**CHAPTER
ONE**

INSTALLATION

jhat works on Python 3+ and requires the following Python packages (these should install automatically when you install jhat):

- numpy
- matplotlib
- astropy
- jwst
- scipy
- photutils
- pysiaf
- astroquery
- pandas
- stsci skypac

1.1 Install using pip

Using pip:

```
pip install jhat
```

1.2 Install Development Version

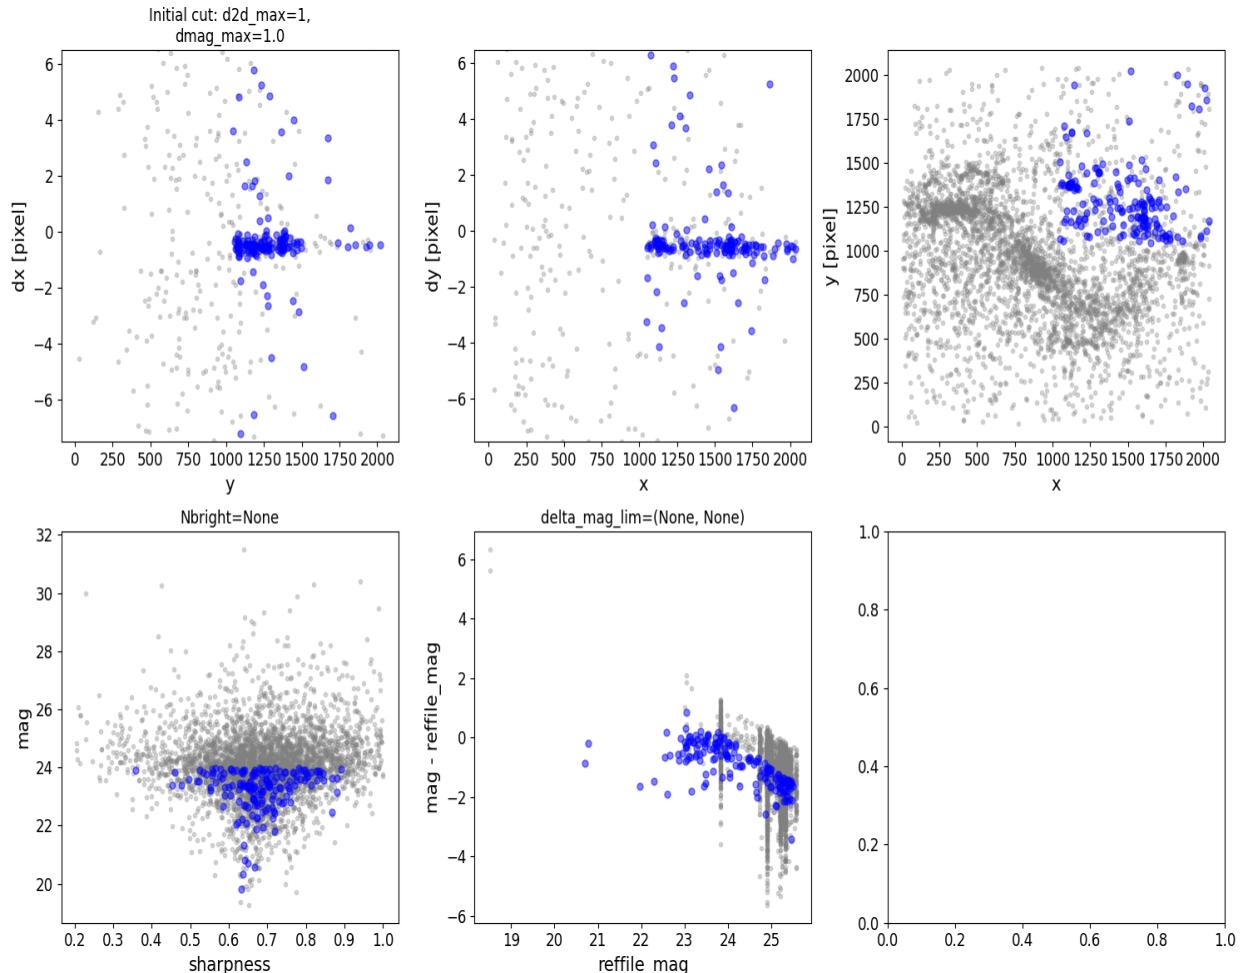

Using git:

```
git clone https://github.com/arminrest/jhat.git
cd jhat
python setup.py install
```

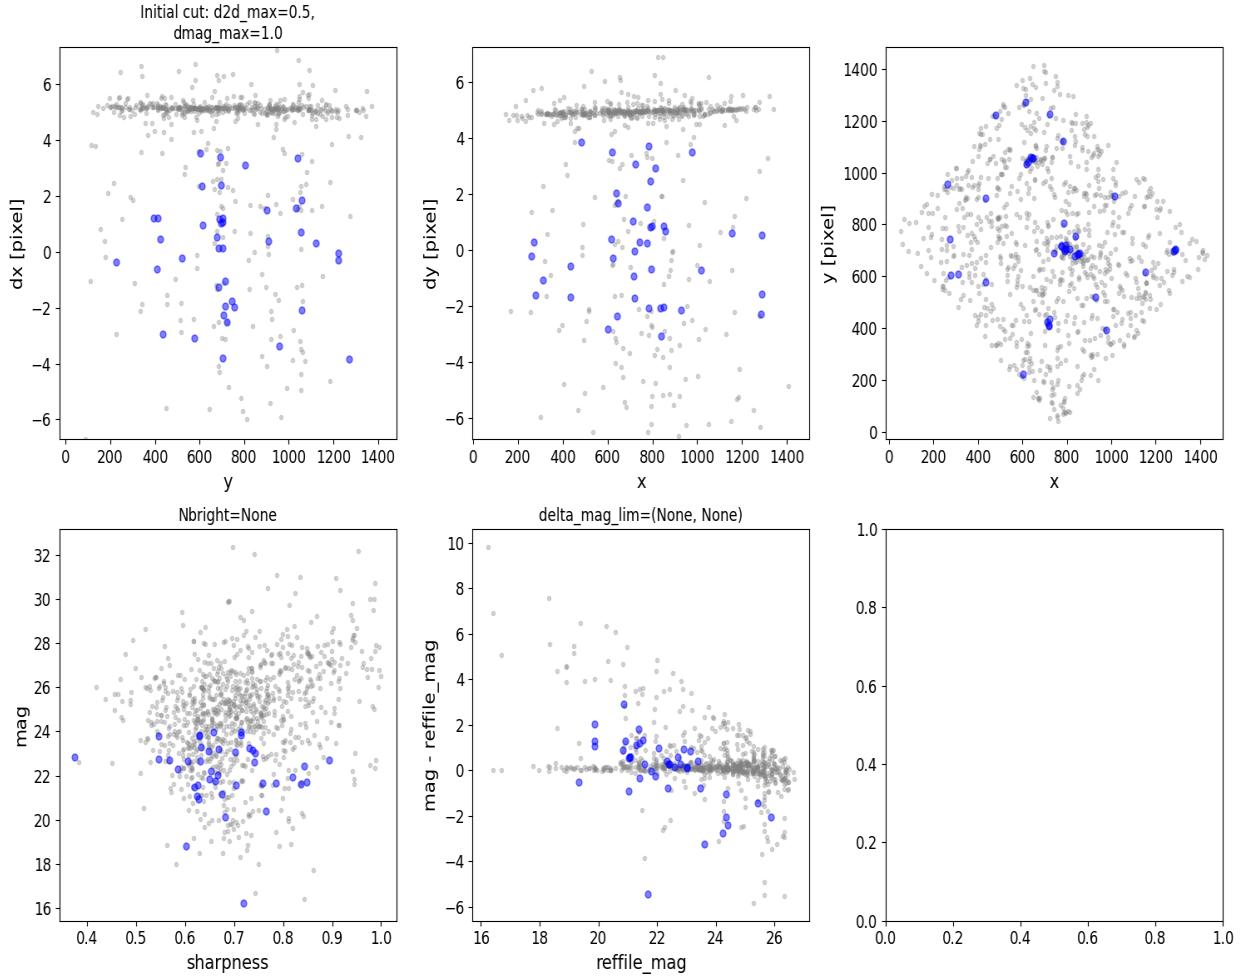

CHAPTER TWO

INTERPRETING PLOTS

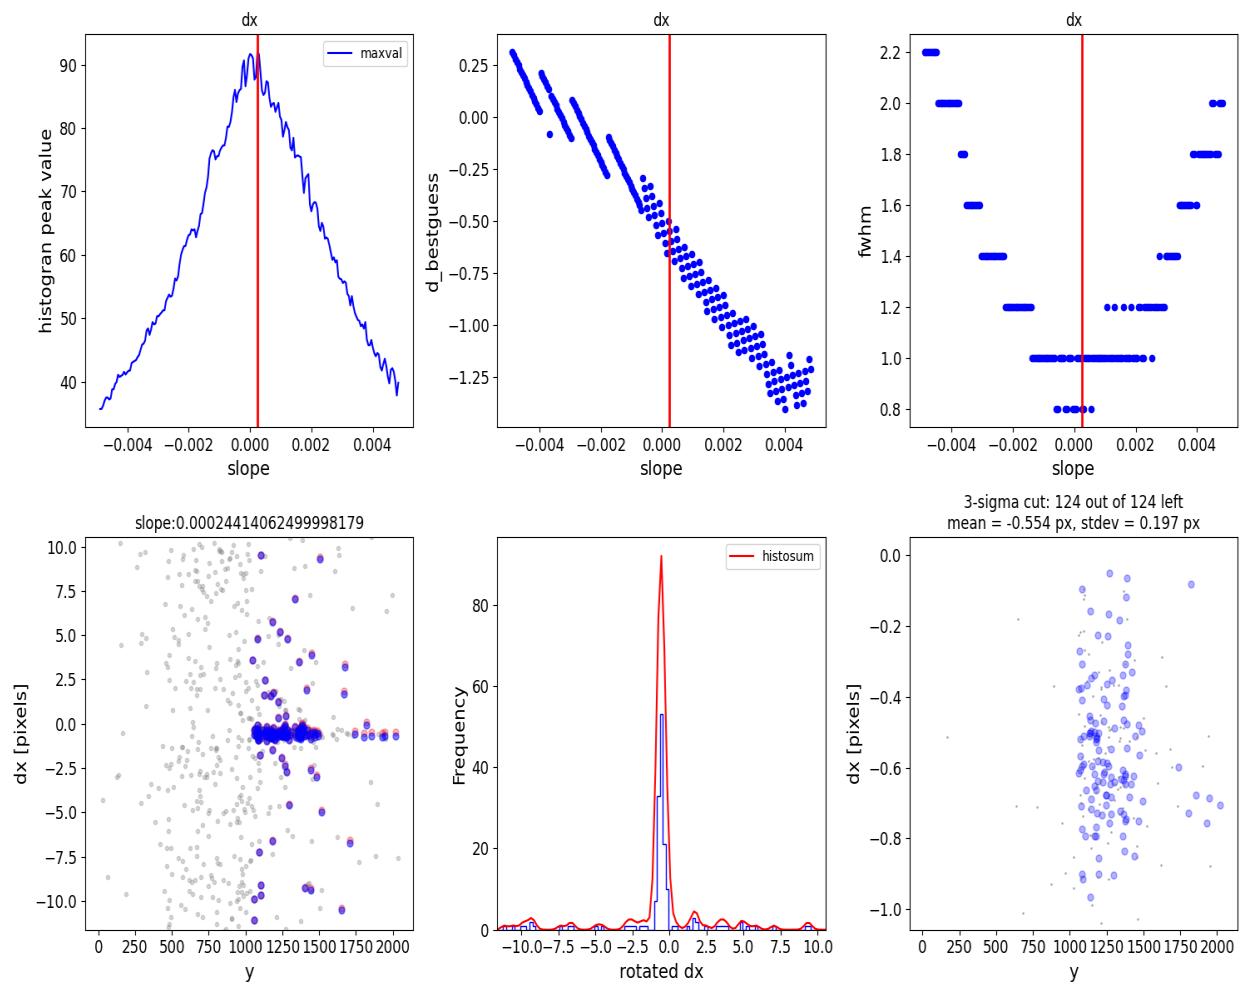

This is the initial plot to check if things are going the right direction. Here each point is a source detected in the image. Blue points have passed the initial cuts, gray points fail cuts are are not used. If there is a locus in both dx and dy, then the code will be able to find the correct alignment parameters. The second row just shows the same sources as a function of some photometric parameters.

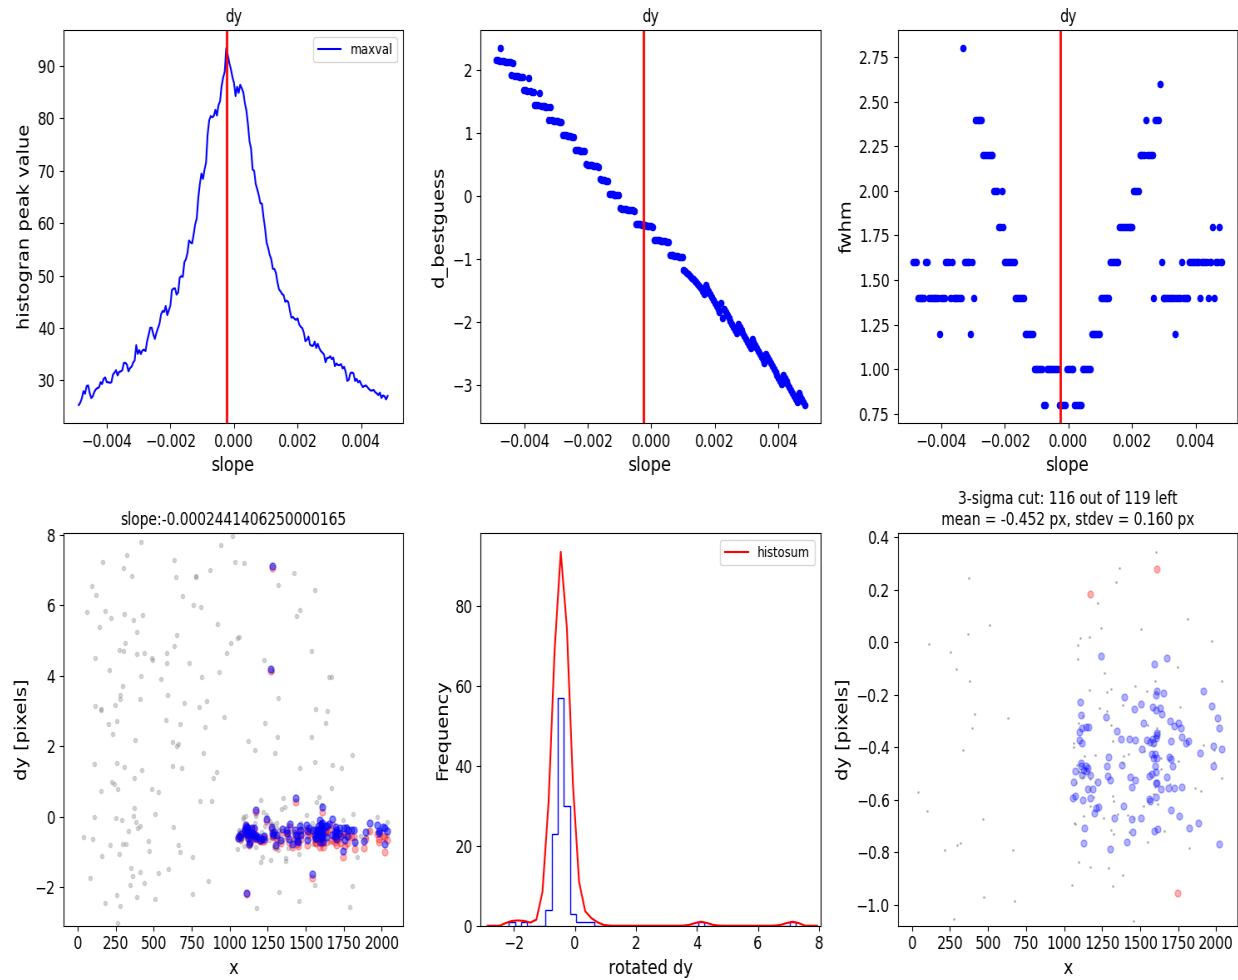

This is an example of the same set of plots for a case where the alignment has failed. No locus is apparent in dx or dy. If there is no relation to be seen in this initial plot, then cuts and params need to be changed/loosened (see [Useful Parameters](#)), in this case d2d_max should be increased.

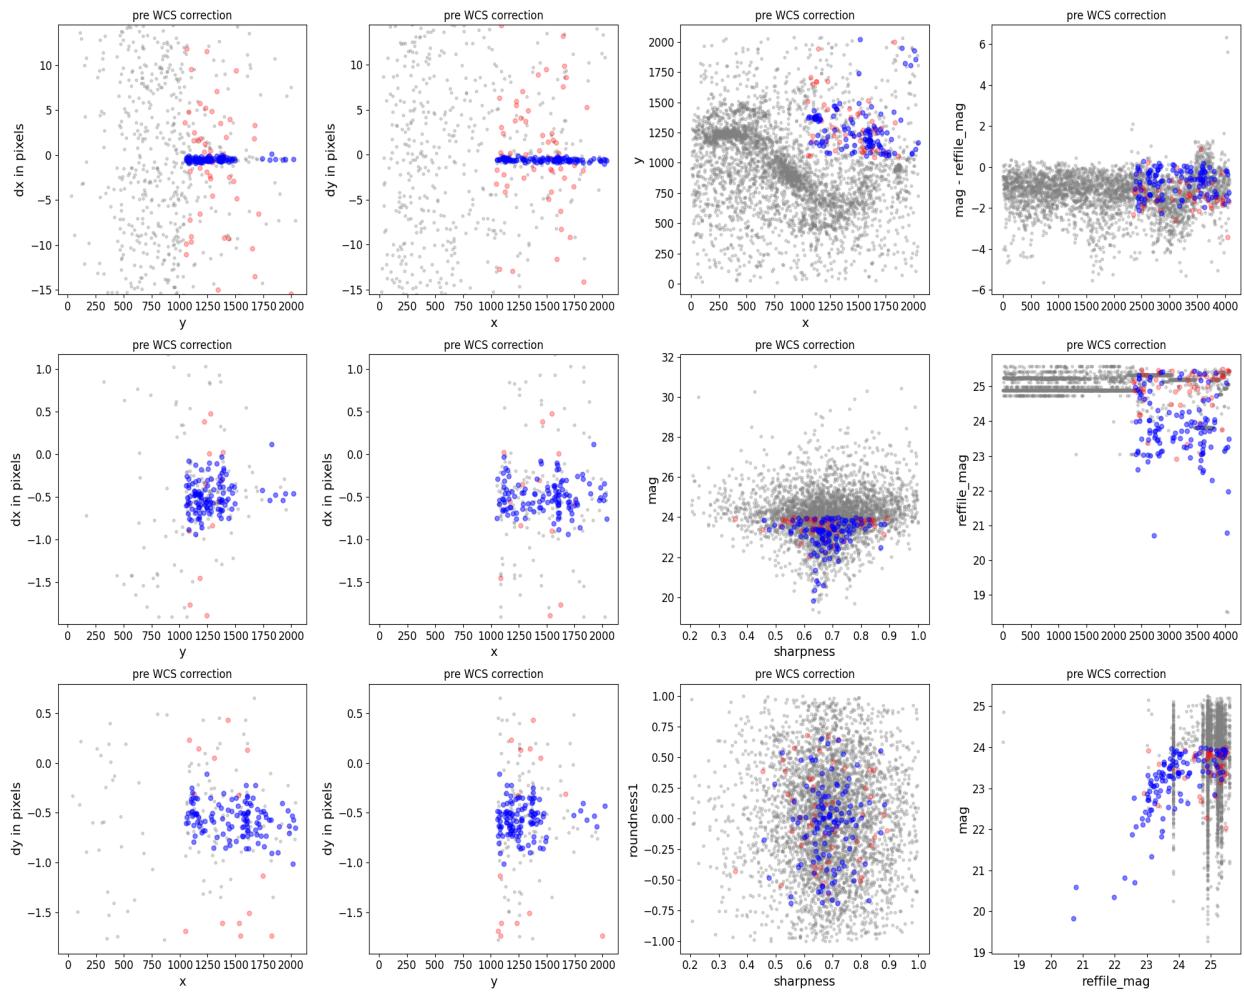

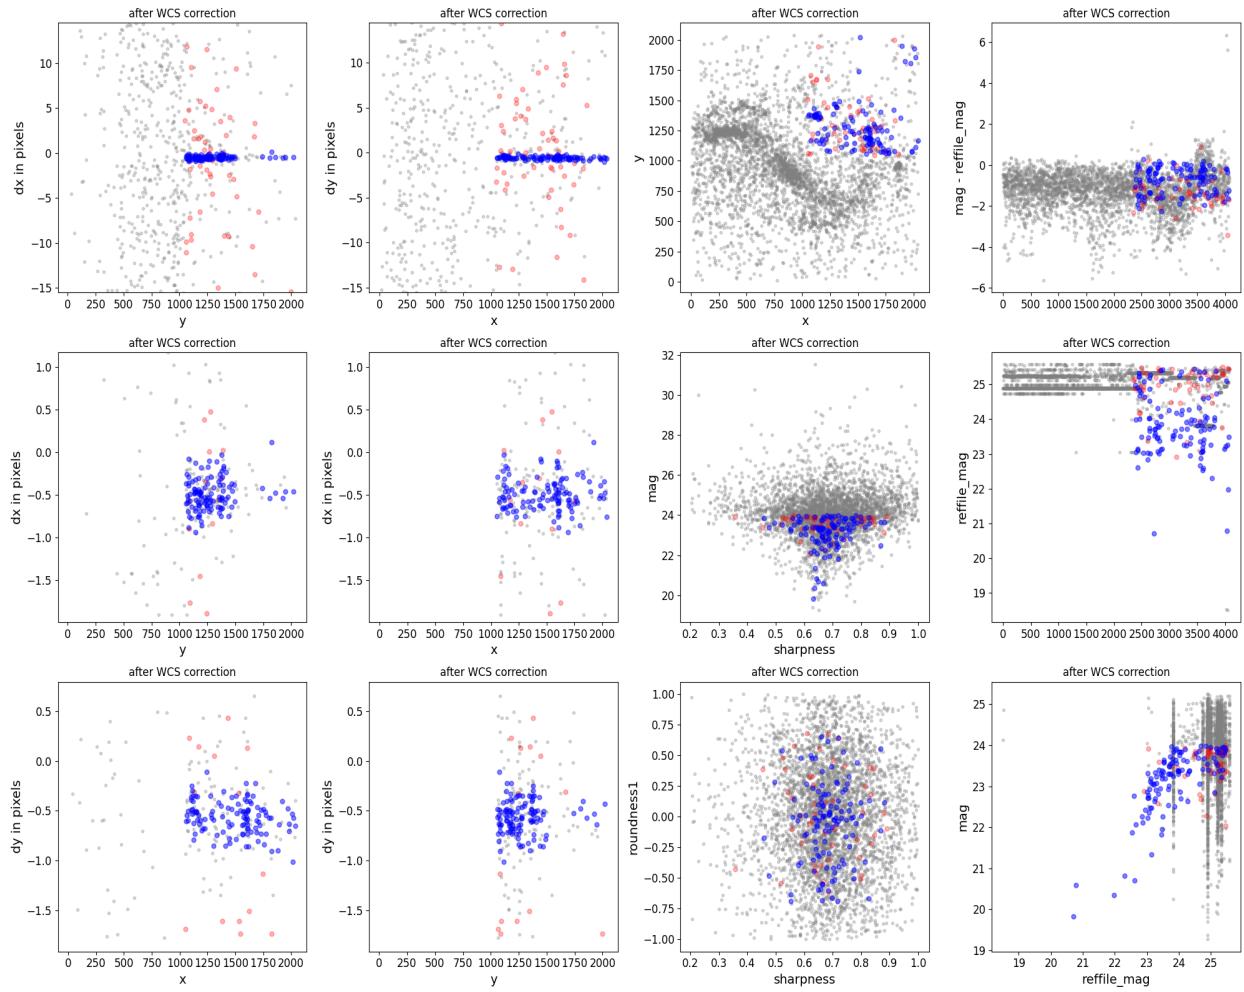

The second important set of plots comes from the selection of good matches between reference catalog and target image source catalog. First the best rotation and offset is chosen for dx, which is successful if there is a clear peak in the upper left panel (histogram peak value versus slope). In the second row, blue dots are sources that are kept after rotation, and red are the original unrotated dx residuals (lower left panel). Then a 3sigma cut is done on the sources in the dx parameter space, and red indicates the cut values in the far right center row. Finally, the same is done for dy, but ONLY with sources that already passed the dx cut.

Finally, we can check what the alignment did by observing the pre and post wcs-correction plots.

**CHAPTER
THREE**

USEFUL PARAMETERS

Here we describe the most useful parameters and what changing them does inside of the code.

- d2d_max
- sharpness_lim
- roundness1_lim
- delta_mag_lim
- objmag_lim
- refmag_lim
- slope_min
- Nbright4match
- Nbright
- xshift/yshift
- rough_cut_px_min/max
- d_rotated_Nsigma

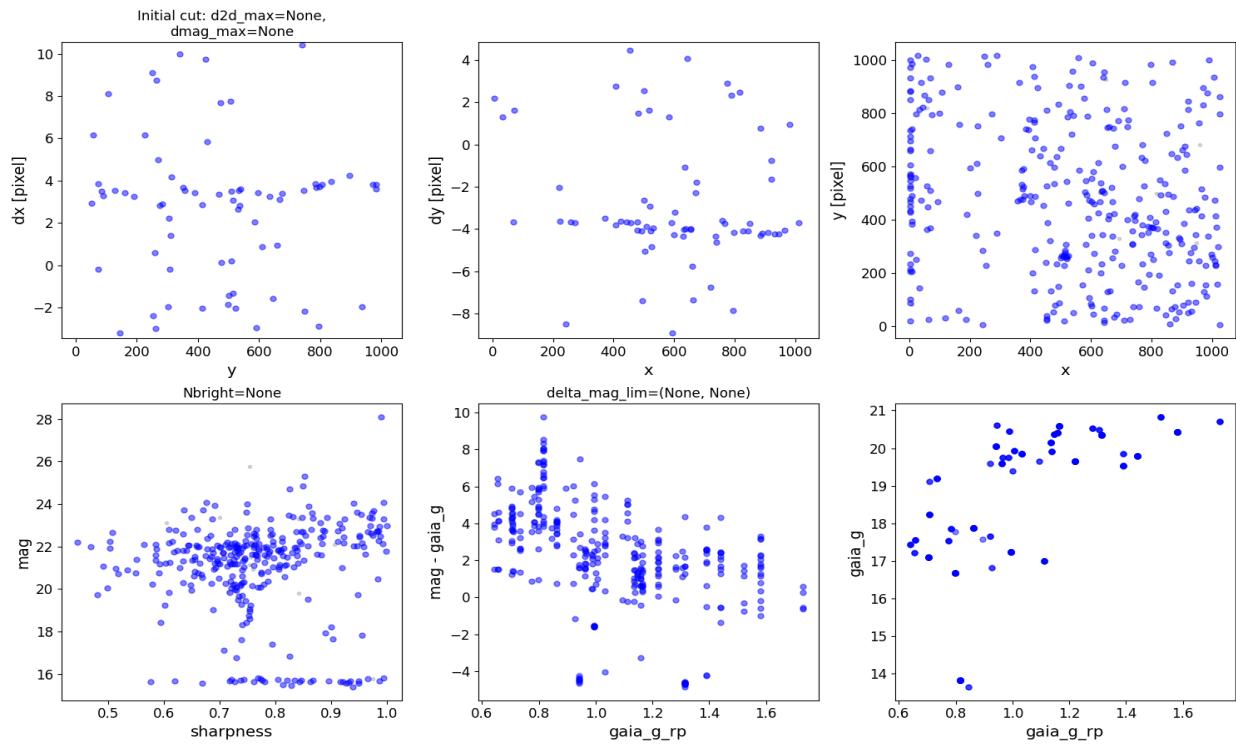

CHAPTER FOUR

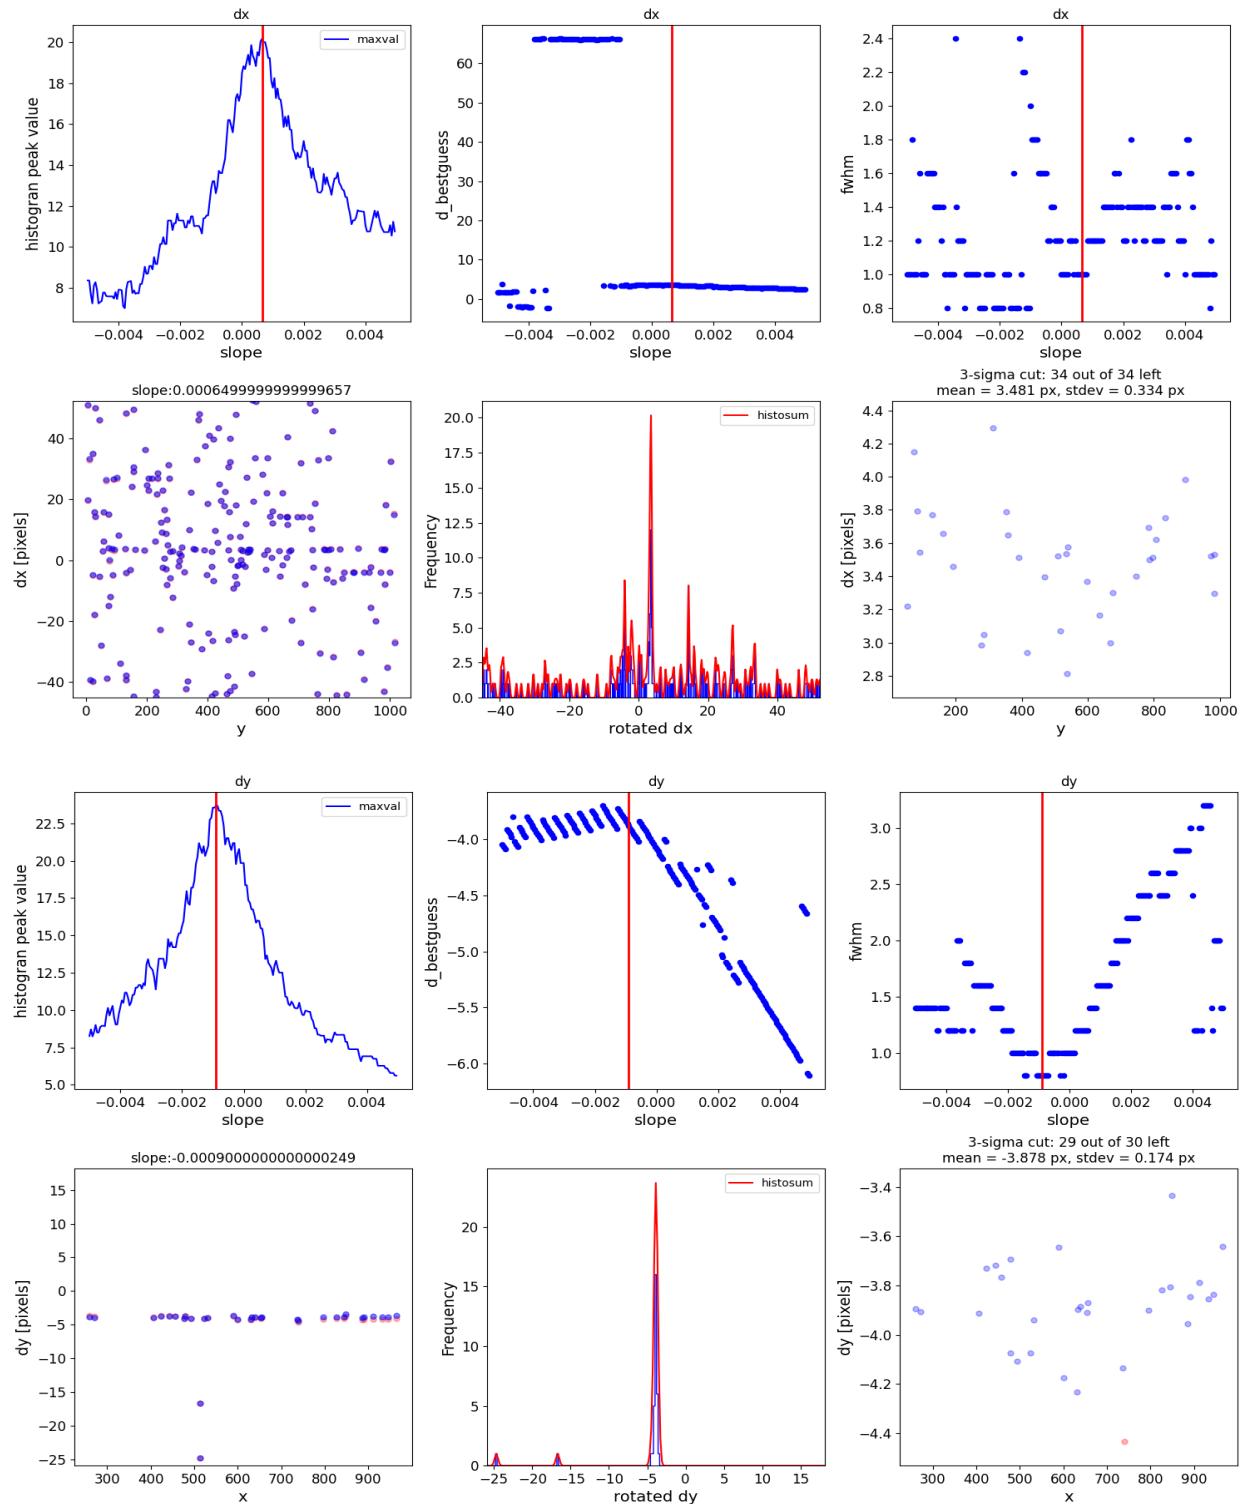

COMMAND LINE COMMANDS

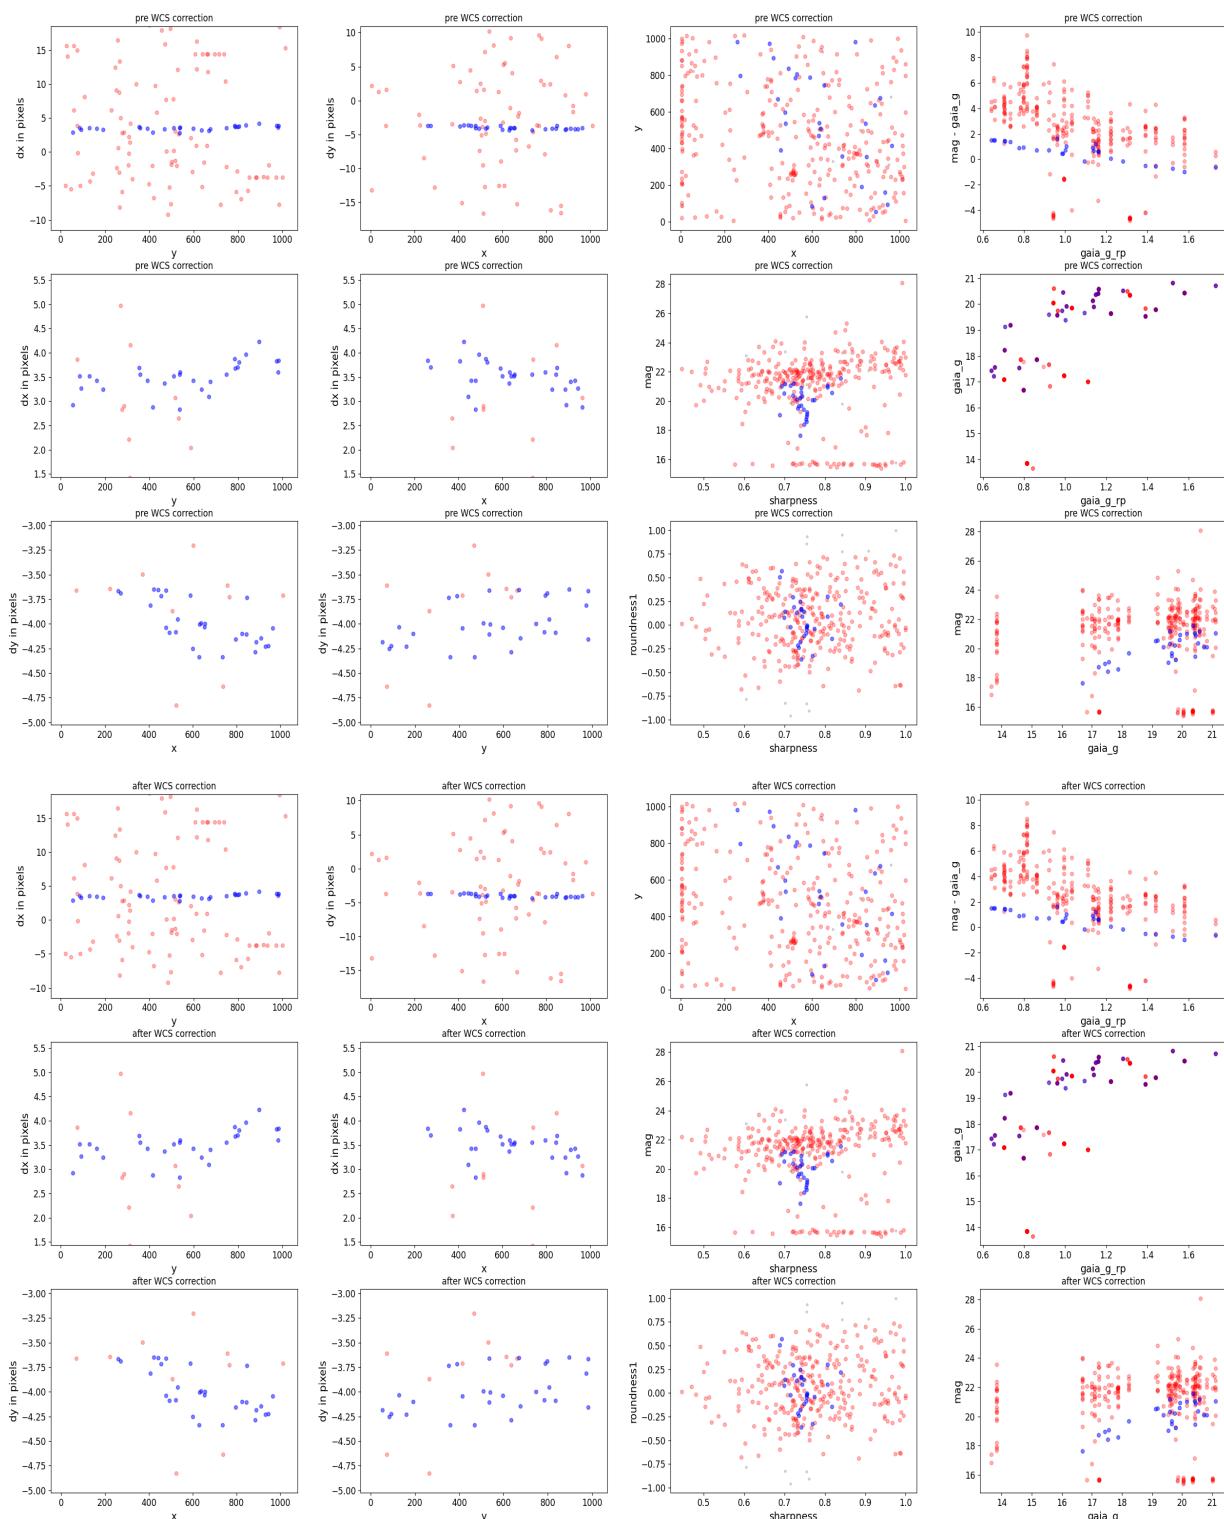

Here we have a directory called “miri_example” that has some MIRI cals. JHAT can also be run from the command line in the following way:

```
run_st_wcs_align.py miri_example/jw02666001001_02101_00001_mirimage_cal.fits --  
--outrootdir '.'  
--outsubdir aligned --overwr -v --refcat gaia --saveplots -tt -pp --histocut_  
--order dxdy
```

Which produces the following plots:

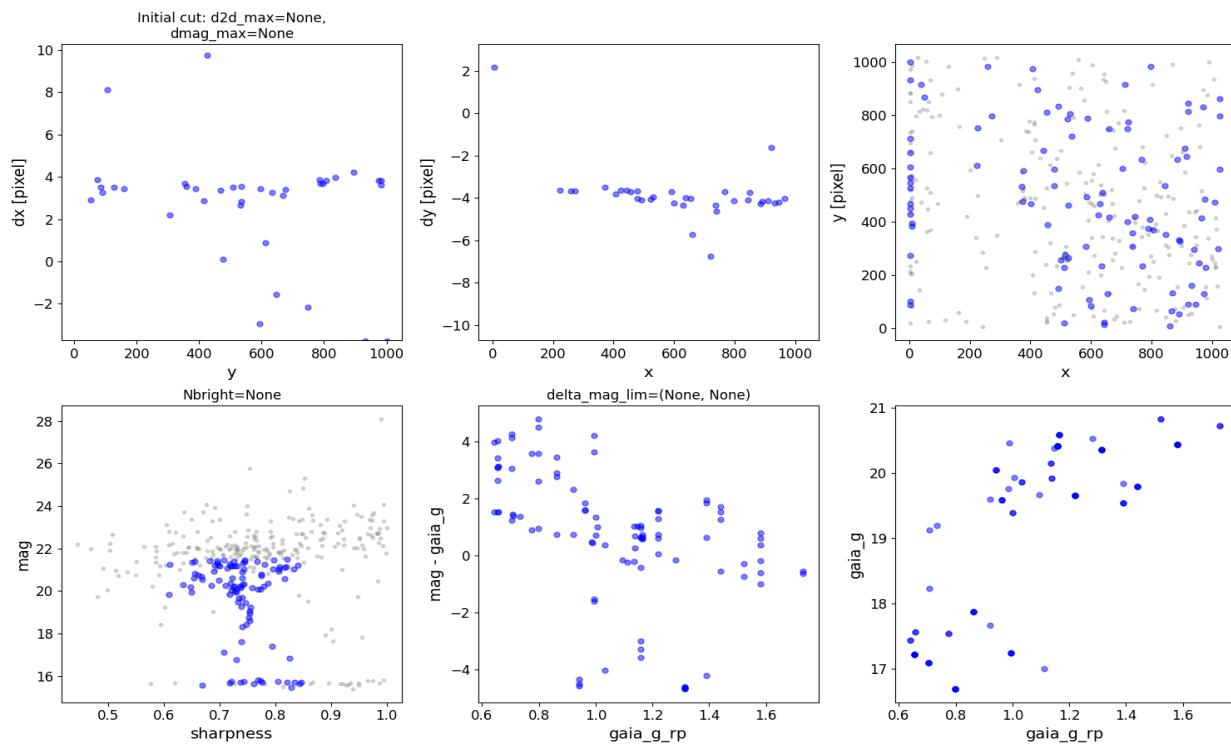

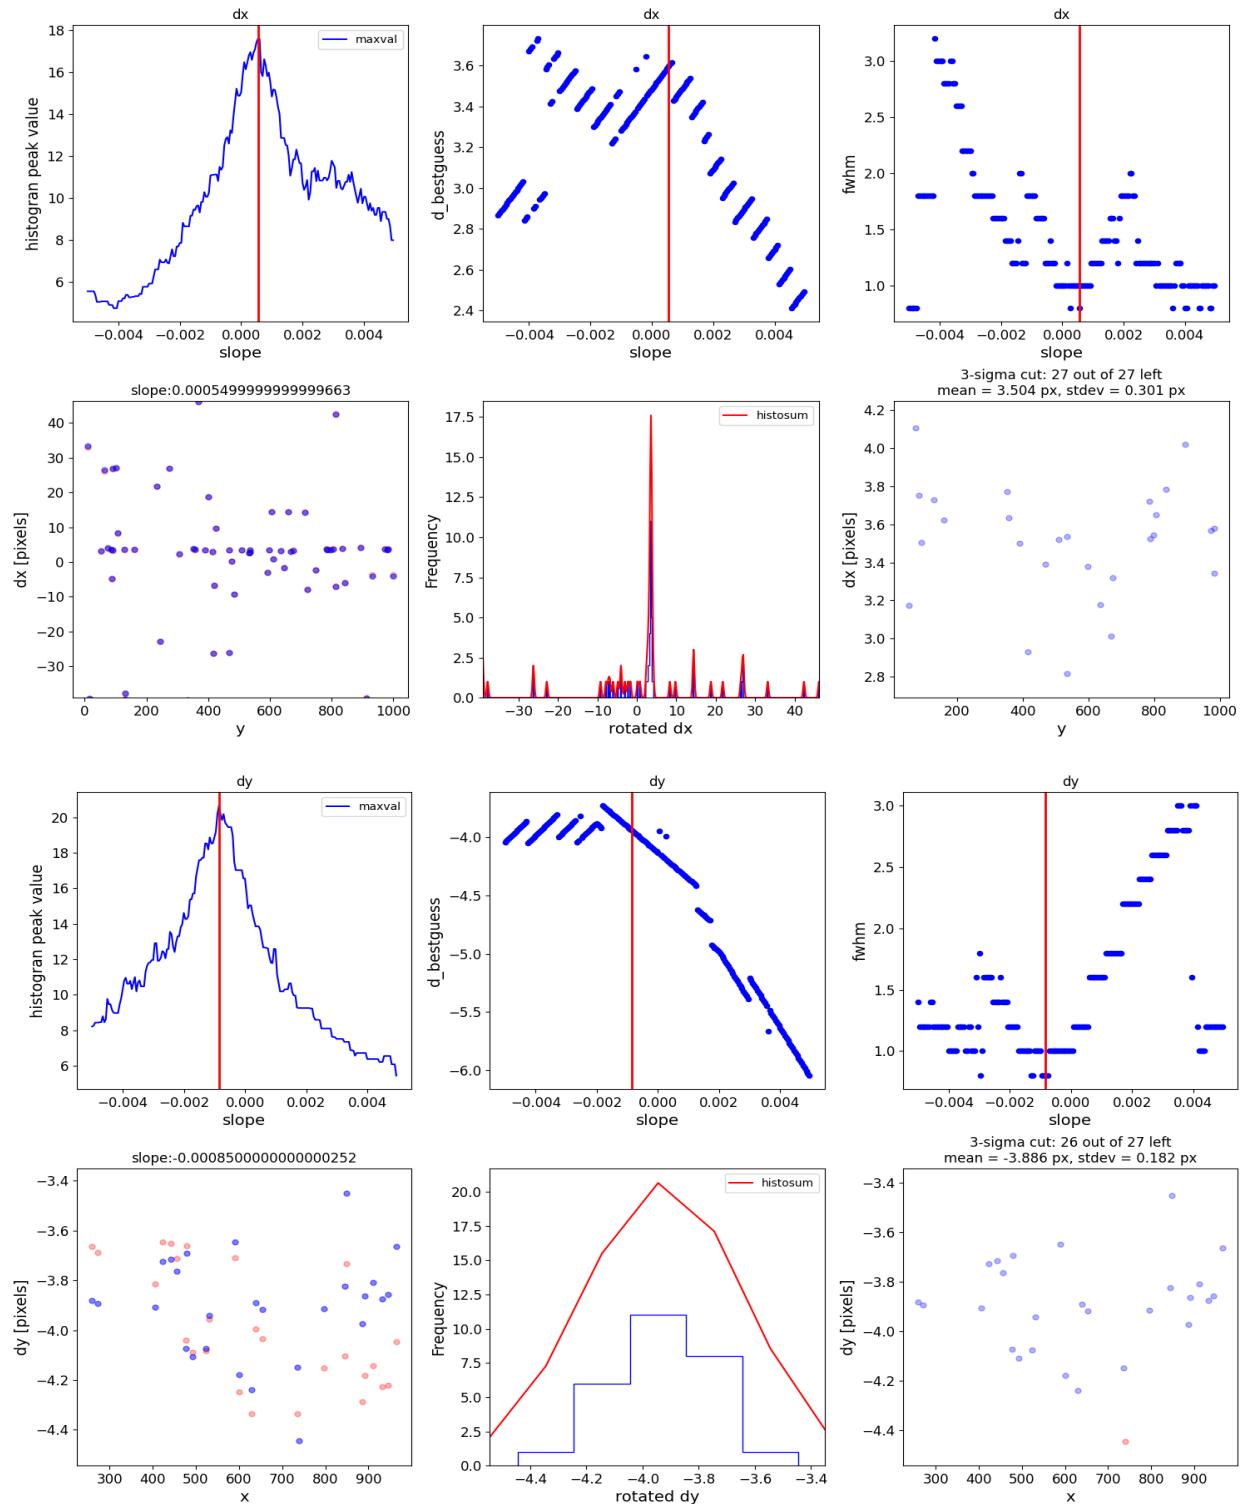

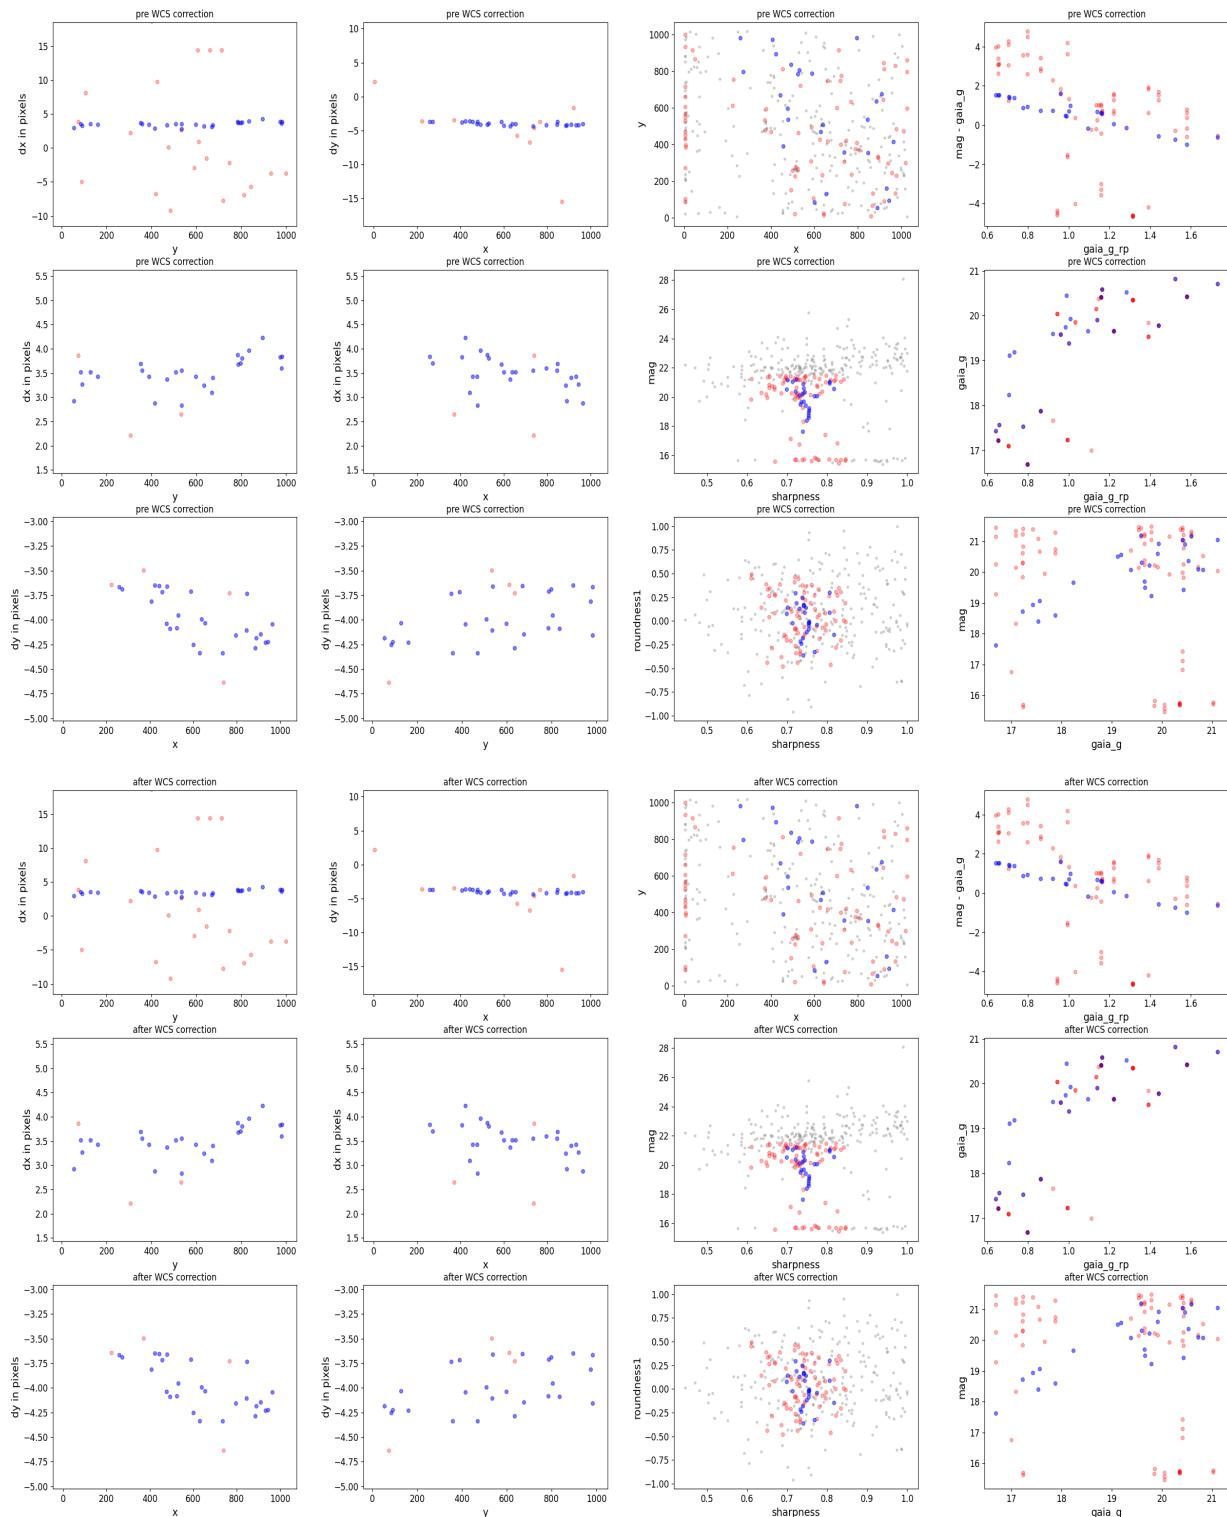

4.1 Improving Alignment

Sometimes, in particular if there are not enough sources or the images are particularly poorly aligned, JHAT has a difficult time finding a good alignment (or it can be improved). Here are a few methods for improving the results. First we add cuts on sharpness, roundness, and brightness:

```
run_st_wcs_align.py miri_example/jw02666001001_02101_00001_mirimage_cal.fits --  
-outrootdir '.'  
    --outsubdir aligned --overwr -v --refcat gaia --saveplots -tt -pp --histocut_  
-order dxdy  
    --roundness1_lim -0.5 0.5 --objmag_lim 14 21.5 --sharpness_lim 0.6 0.85 --refmag_  
-lim 16 25
```

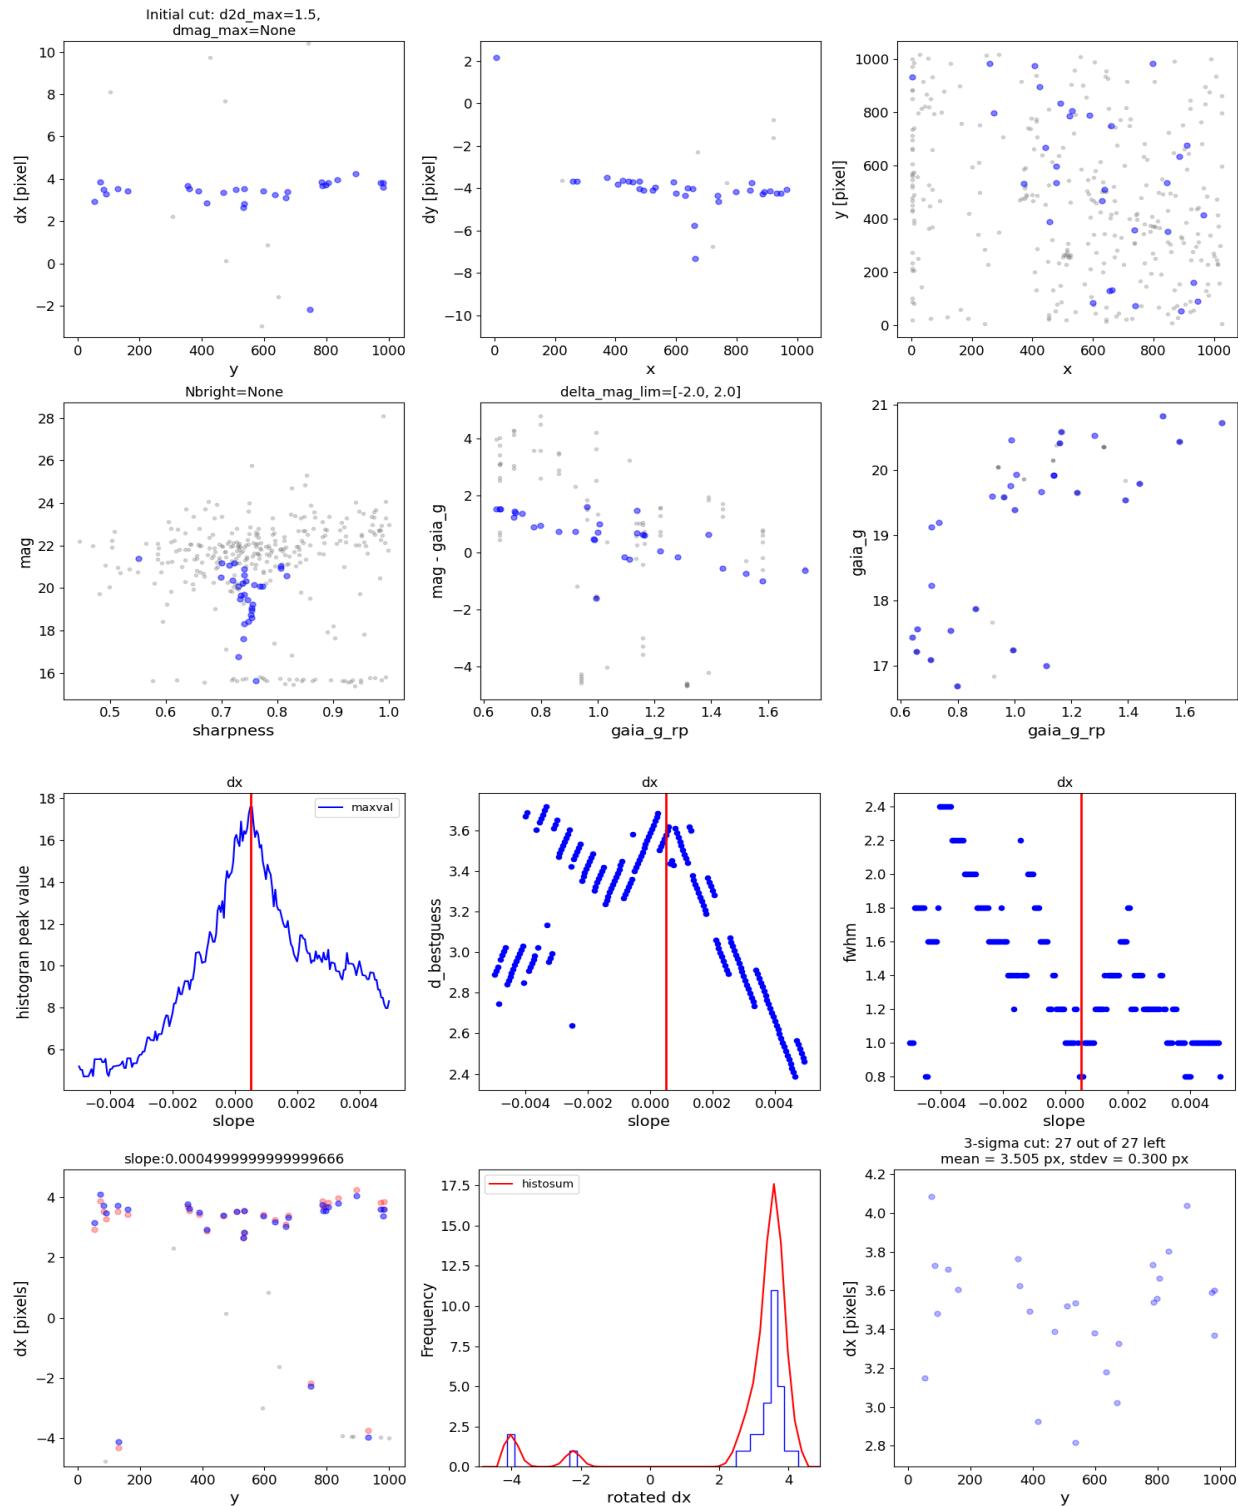

Next we increase the allowed distance between matches between the reference and target catalogs (`d2d_max`), and limit the difference between measured magnitudes between the catalogs.

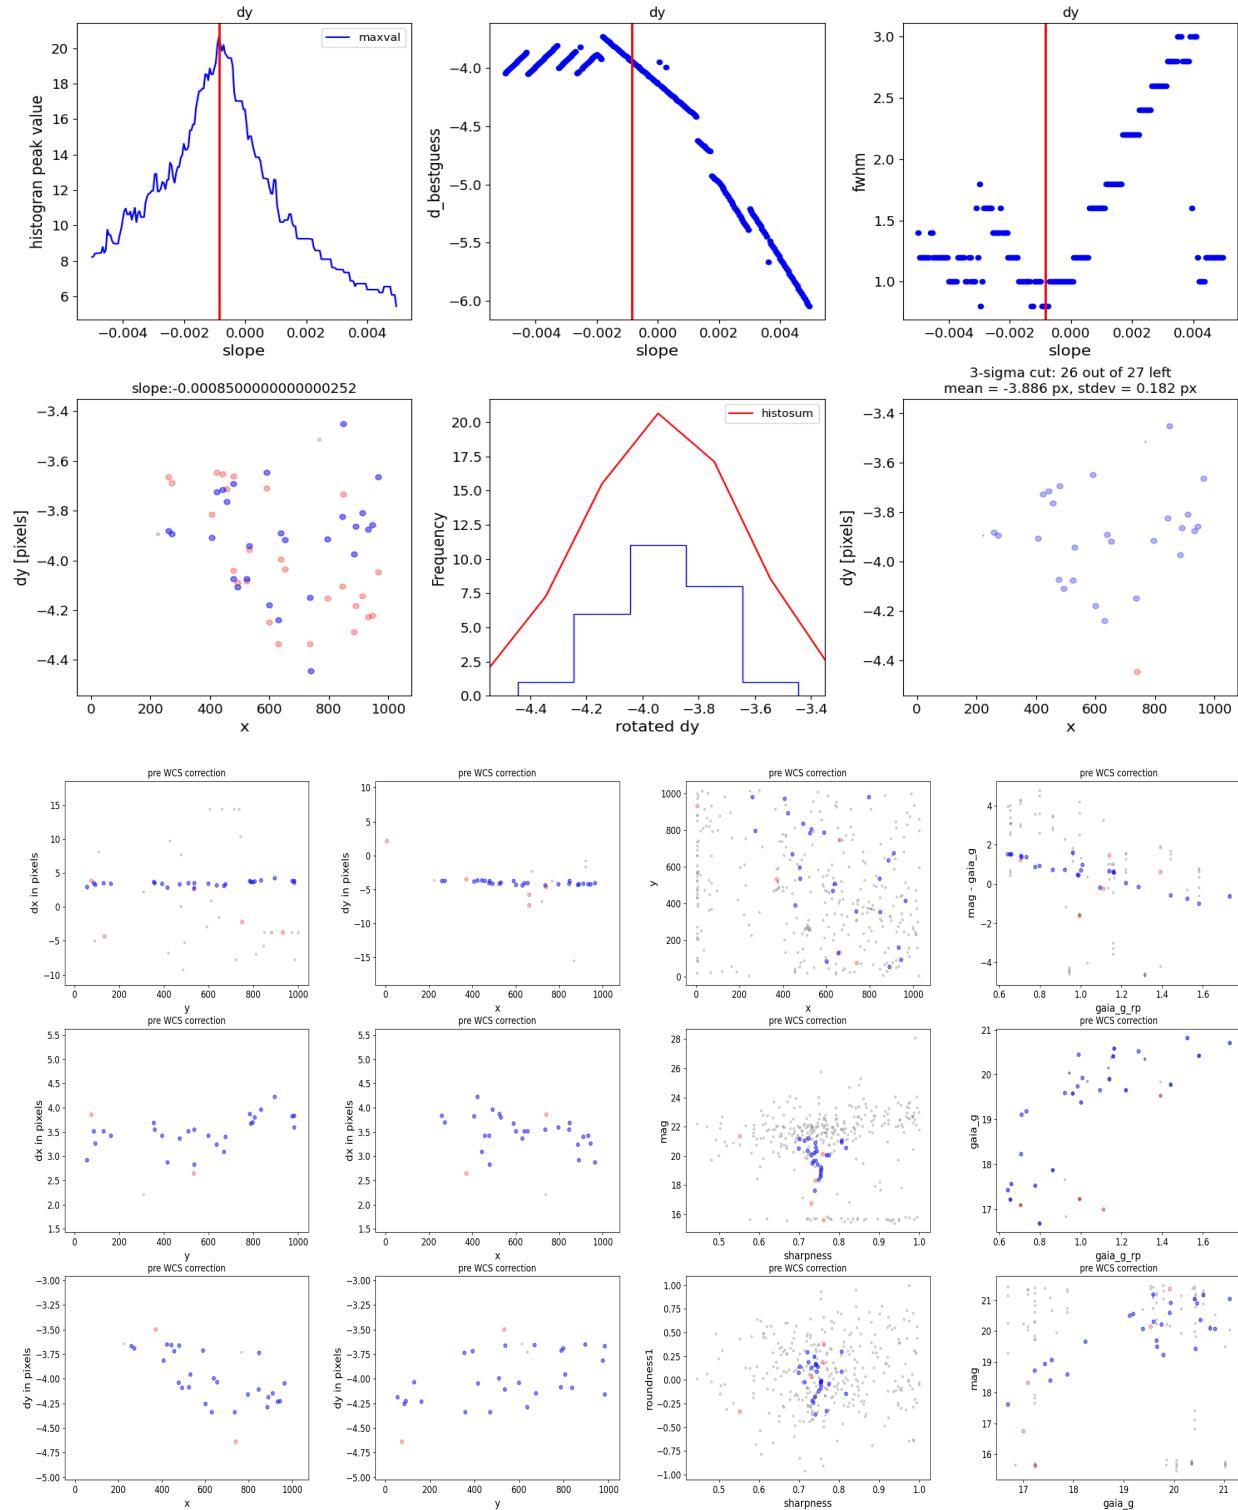

```
run_st_wcs_align.py miri_example/jw02666001001_02101_00001_mirimage_cal.fits --
    ↵outrootdir ''
```

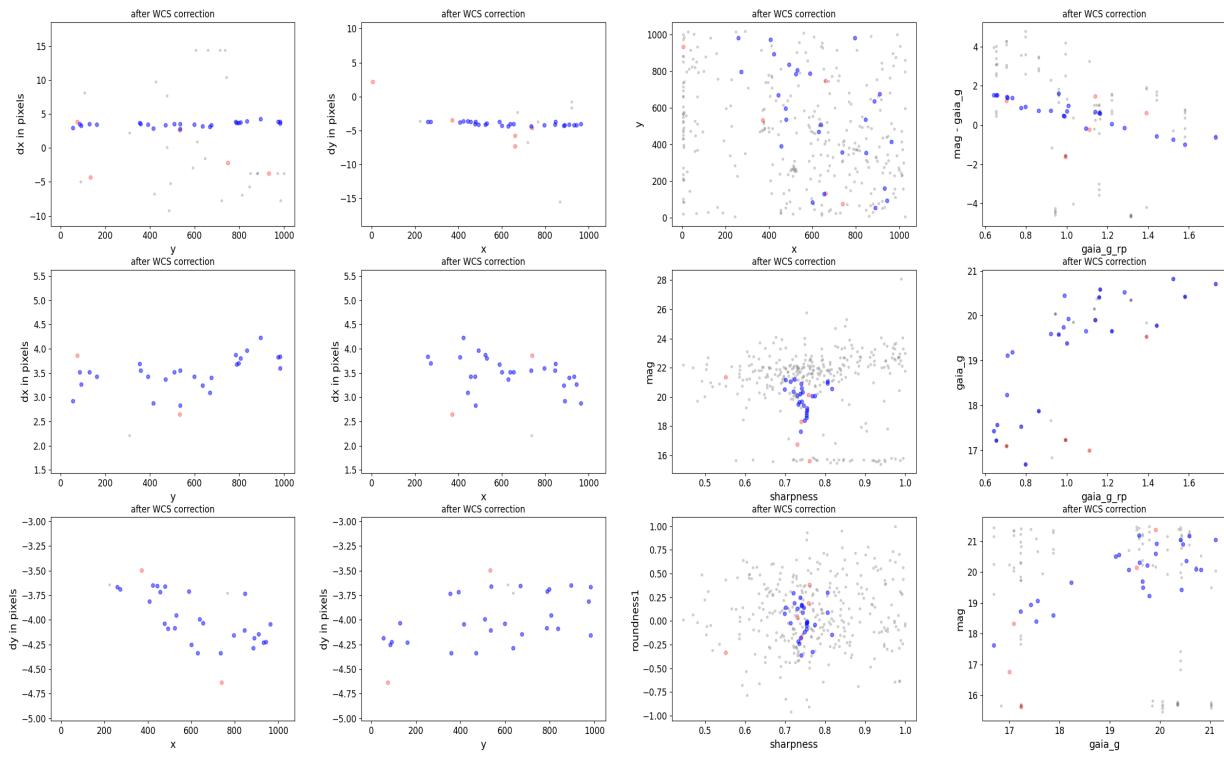

(continues on next page)

(continued from previous page)

```
--outsubdir aligned --overwr -v --refcat gaia --saveplots -tt -pp --histocut_
order dxdy
--roundness1_lim -0.5 0.5 --objmag_lim 14 21.5 --refmag_lim 16 25 --delta_mag_
lim -2 2 --d2d_max 1.5
```

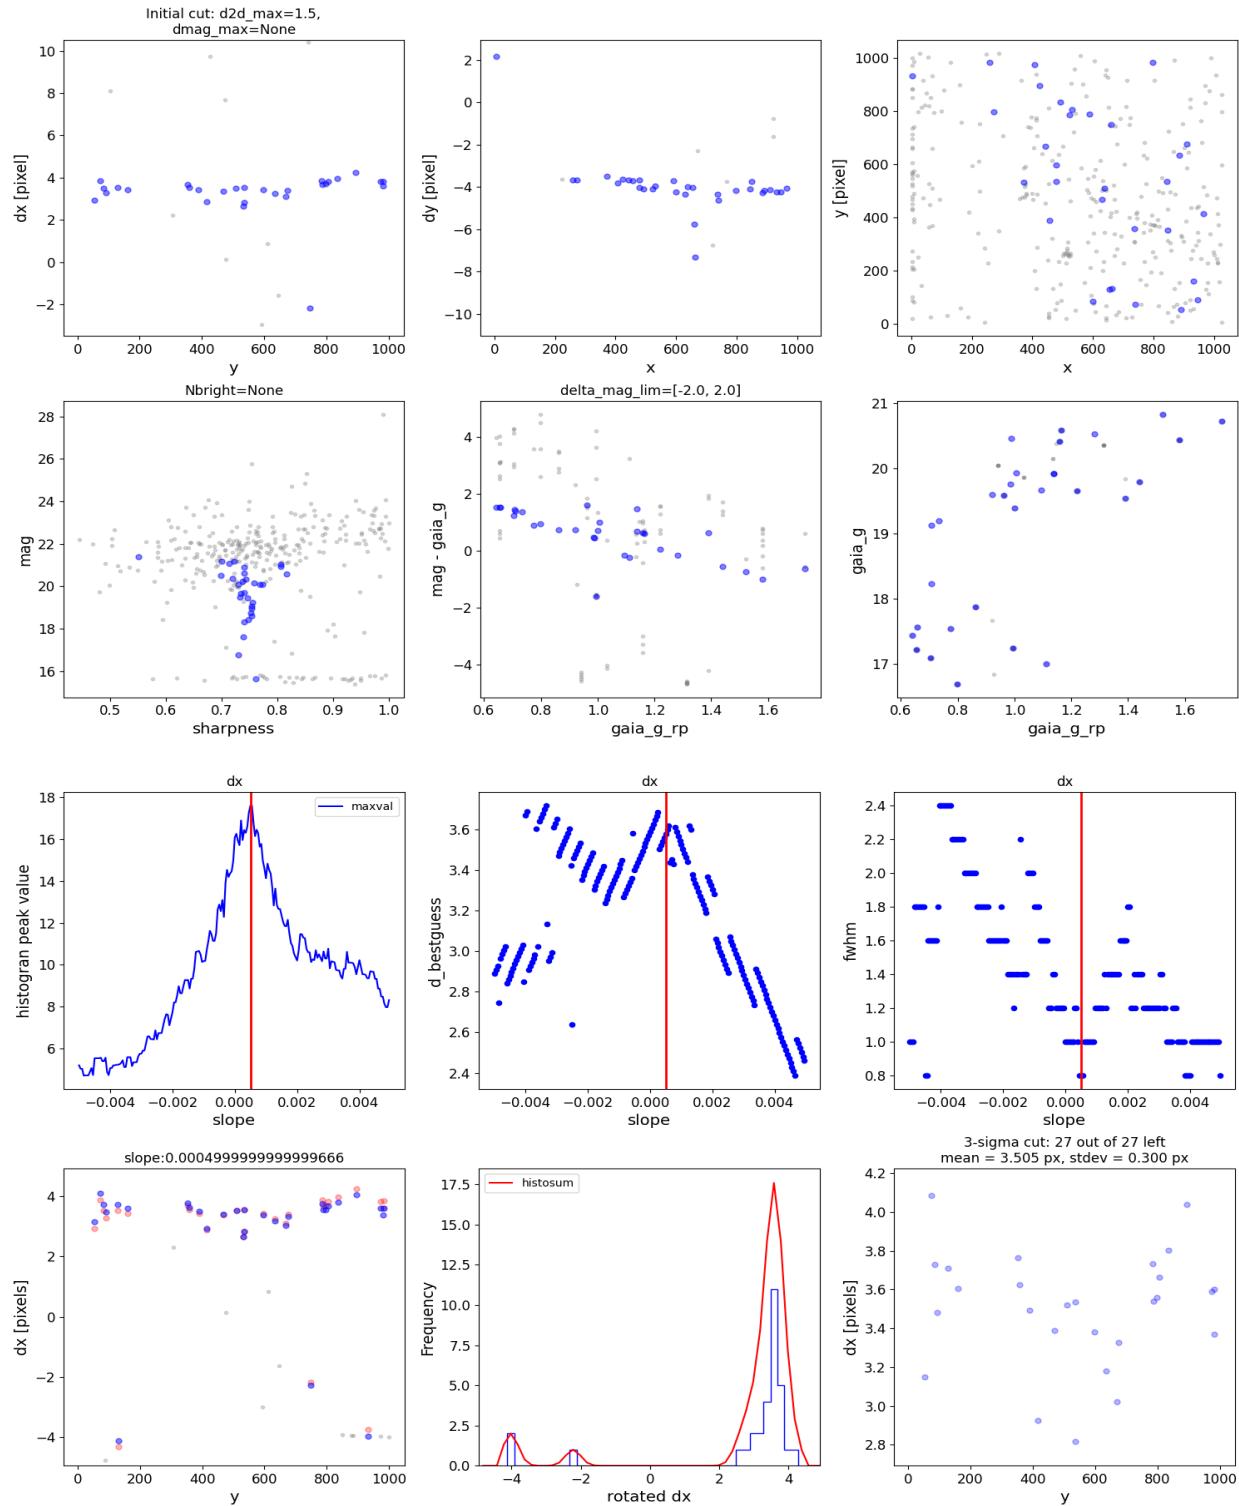

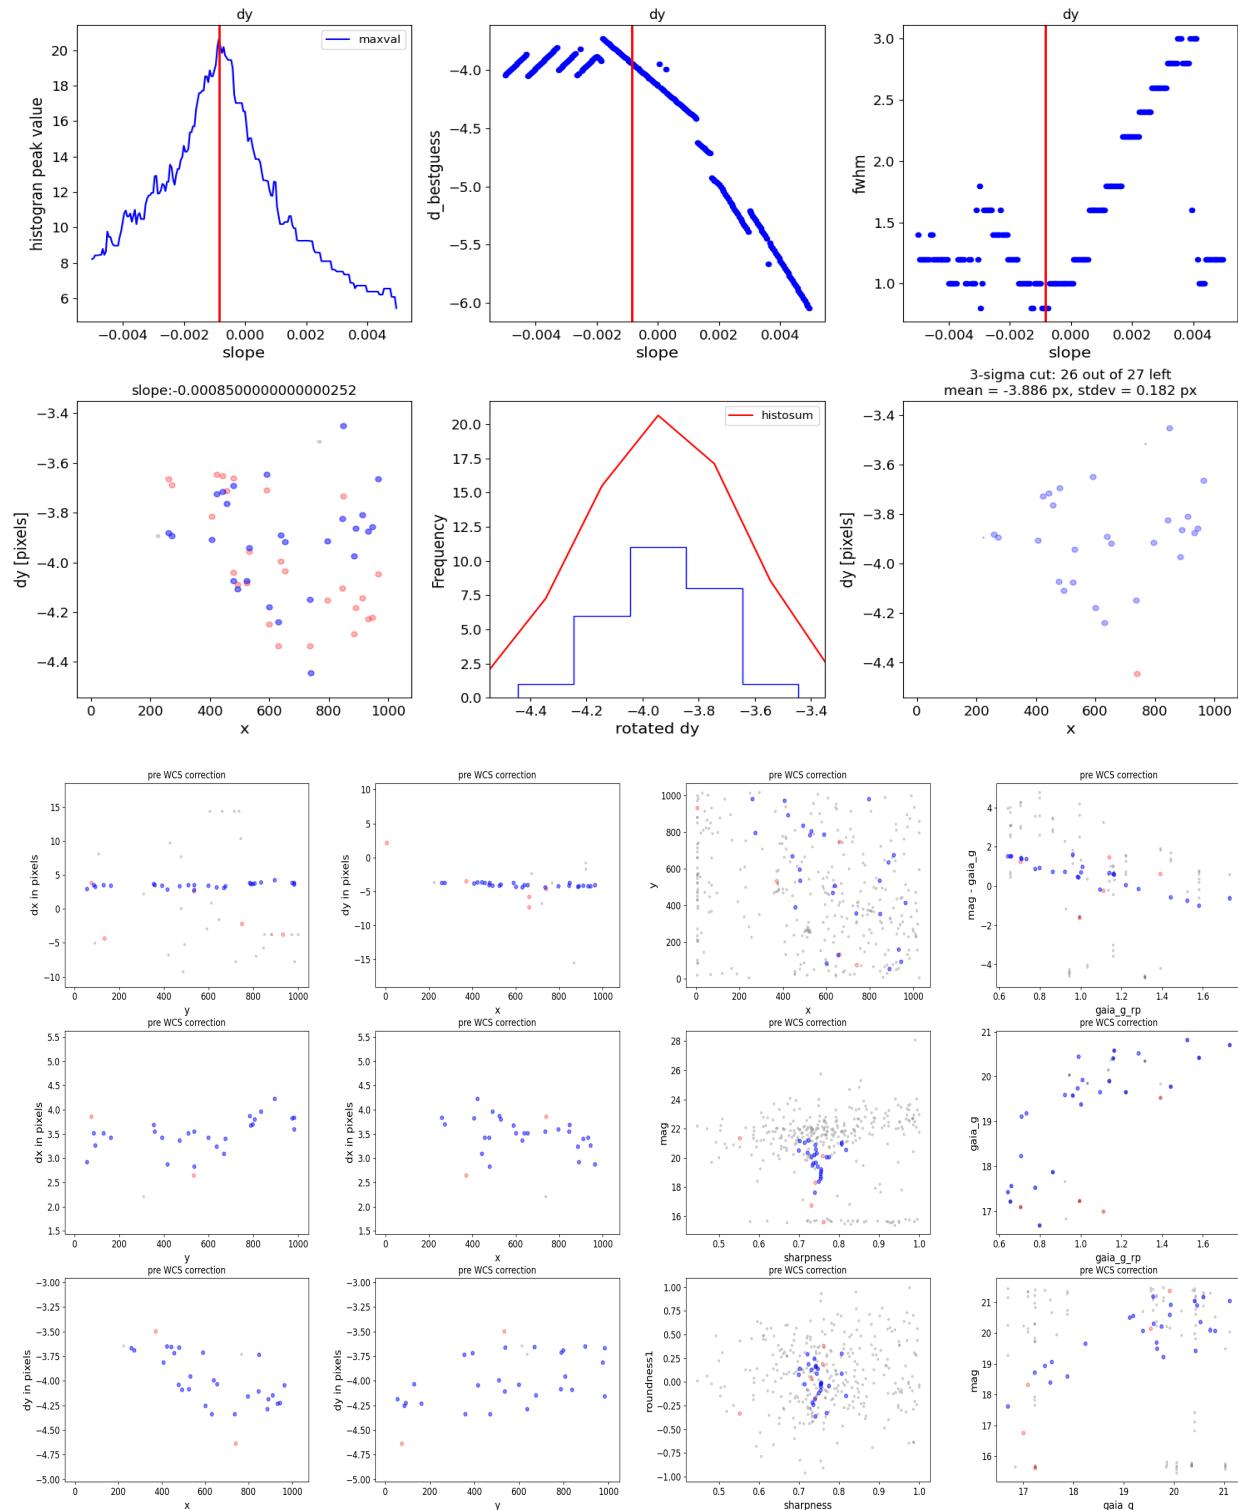

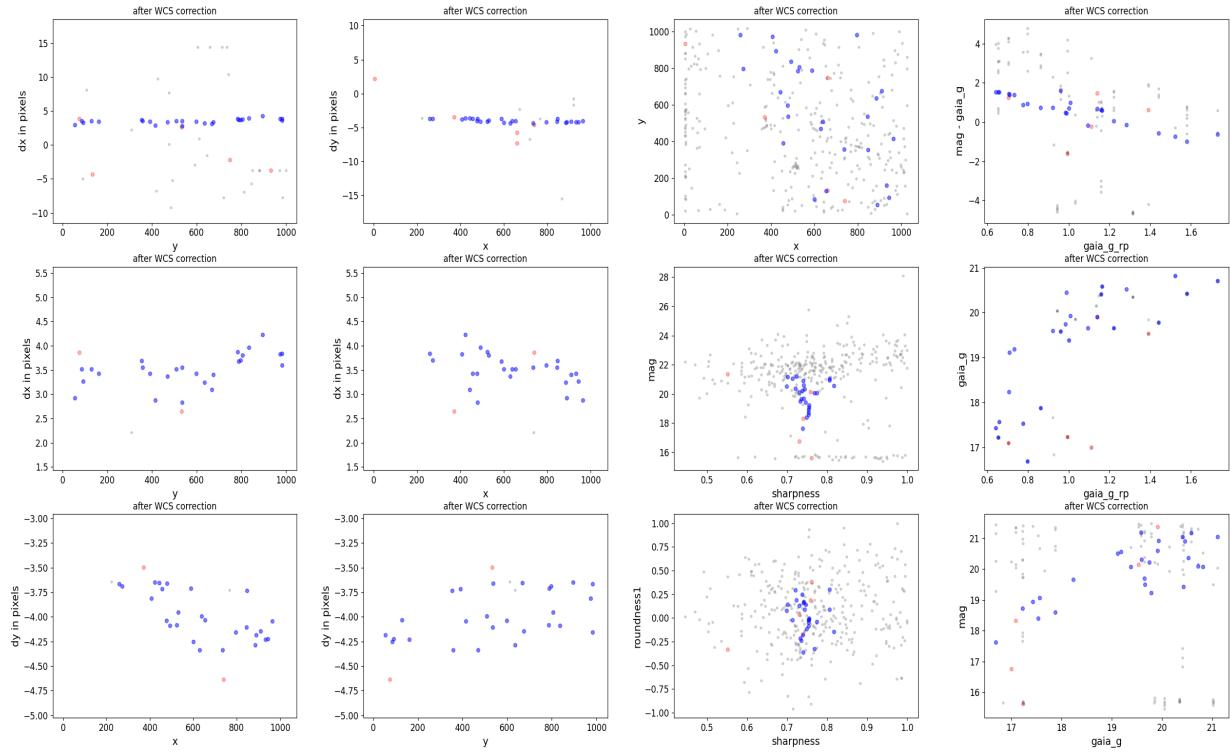

Finally, we might use the previous results to guess the rough needed offset, and apply it directly before the matching begins:

```
run_st_wcs_align.py miri_example/jw02666001001_02101_00001_mirimage_cal.fits --  
outrootdir '..'  
    --outsubdir aligned --overwr -v --refcat gaia --saveplots -tt -pp --histocut_  
order dxdy  
    --roundness1_lim -0.5 0.5 --objmag_lim 14 21.5 --refmag_lim 16 25 --delta_mag_  
lim -2 2  
    --d2d_max 1.5 --xshift 3 --yshift -4
```

LEVEL 3 FROM ALIGNED CALS

We run F560W with the best options determined from the *Improving Alignment* example:

```
run_st_wcs_align_batch.py --input_dir '.' --input_files 'miri_example/*_cal.fits' --  
    ↵outrootdir aligned  
        --outsubdir F560W_level2_gaia --overwr -v --refcat gaia --saveplots -tt -pp --  
    ↵histocut_order dxdy  
        --roundness1_lim -0.5 0.5 --objmag_lim 14 21.5 --refmag_lim 16 25 --delta_mag_  
    ↵lim -2 2  
        --d2d_max 1.5 --xshift 3 --yshift -4 --filter F560W
```

Now we run the notebook that runs level3 and creates the mosaic and the corresponding catalog (On GitHub [here](#)). That notebook produces a catalog (F560W_snr3_npix10_cat.ecsv), which we choose as our secondary astrometric catalog.

Now we run the rest of the filters. However, we remove --delta_mag_lim, since this cut depends on the filter!!! Note that we define the necessary column names from the catalog, which are different from the defaults.

```
run_st_wcs_align_batch.py --input_dir '.' --input_files 'miri_example/*_cal.fits' --  
    ↵outrootdir miri_example  
        --outsubdir ALL_level2_catF560W --overwr -v --refcat F560W_snr3_npix10_cat.ecsv  
    ↵--saveplots -tt -pp  
        --histocut_order dxdy --roundness1_lim -0.5 0.5 --objmag_lim 14 21.5 --refmag_  
    ↵lim 16 25 --d2d_max 1.5  
        --xshift 3 --yshift -4 --iterate_with_xyshifts --refcat_racol sky_centroid.ra  
            --refcat_deccol sky_centroid.dec --refcat_magcol aper50_abmag --refcat_  
    ↵magerrcol aper50_abmag_err  
        --filters F560W F1000W F1280W F1130W F1500W F1800W
```

We find that F1500W F1800W mostly work, but don't have many stars. Therefore we run it with --d_rotated_Nsigma 0.0: Too few stars to do a 3-sigma cut.

```
run_st_wcs_align_batch.py --input_dir '.' --input_files 'miri_example/*_cal.fits' --  
    ↵outrootdir miri_example  
        --outsubdir ALLRED_level2_catF560W --overwr -vvv --refcat F560W_snr3_npix10_cat.  
    ↵ecsv --saveplots -tt -pp  
        --histocut_order dxdy --roundness1_lim -0.5 0.5 --objmag_lim 14 21.5 --refmag_  
    ↵lim 16 25 --d2d_max 1.5 --xshift 3  
        --yshift -4 --iterate_with_xyshifts --refcat_racol sky_centroid.ra --refcat_  
    ↵deccol sky_centroid.dec --refcat_magcol  
        aper50_abmag --refcat_magerrcol aper50_abmag_err --filters F1500W F1800W  
    ↵F2100W --d_rotated_Nsigma 0.0
```

CHAPTER
SIX

EXAMPLES

6.1 JWST MIRI

Aligning JWST/MIRI images with JHAT.

An example MIRI Dataset is downloaded, and then a series of alignment methods are used. For more information on the key parameters used for alignment see [Useful Parameters](#).

```
import sys,os,glob
from astropy.io import fits
from astropy.table import Table
from astropy.nddata import extract_array
from astropy.coordinates import SkyCoord
from astropy import wcs
from astropy.wcs.utils import skycoord_to_pixel
from astropy import units as u
import numpy as np
import matplotlib.pyplot as plt
from astroquery.mast import Observations
from astropy.visualization import (simple_norm,LinearStretch)

import jhat
from jhat import jwst_photclass,st_wcs_align
```

6.1.1 Relative Alignment

Download some Data

For this example we download 2 MIRI cal images from MAST. They're the same field and different filters. Note that the code will also work for level 3 images.

```
obs_table1 = Observations.query_criteria(obs_id='jw02107-o038_t019_miri_f770w')
data_products_by_obs = Observations.get_product_list(obs_table1)
data_products_by_obs = data_products_by_obs[data_products_by_obs['calib_level']==2]
data_products_by_obs = data_products_by_obs[data_products_by_obs[
    'productSubGroupDescription']=='CAL'][0]
Observations.download_products(data_products_by_obs,extension='fits')

obs_table2 = Observations.query_criteria(obs_id='jw02107-c1018_t019_miri_f1130w')
data_products_by_obs = Observations.get_product_list(obs_table2)
```

(continues on next page)

(continued from previous page)

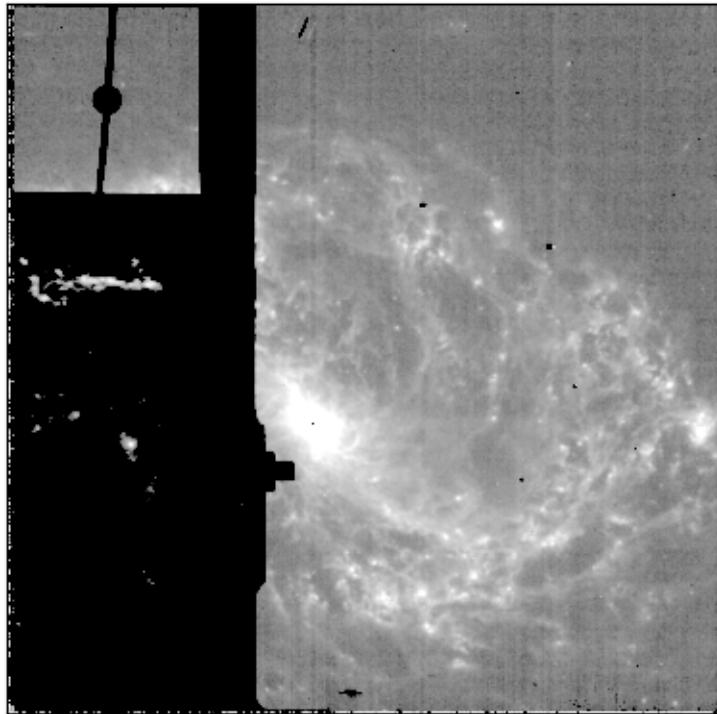

```
data_products_by_obs = data_products_by_obs[data_products_by_obs['calib_level']==2]
data_products_by_obs = data_products_by_obs[data_products_by_obs[
    ↪'productSubGroupDescription']=='CAL'][0]
Observations.download_products(data_products_by_obs,extension='fits')
```

```
Downloading URL https://mast.stsci.edu/api/v0.1/Download/file?uri=mast:JWST/product/
↪jw02107038001_02101_00001_mirimage_cal.fits to ./mastDownload/JWST/jw02107038001_02101_
↪00001_mirimage/jw02107038001_02101_00001_mirimage_cal.fits ... [Done]
Downloading URL https://mast.stsci.edu/api/v0.1/Download/file?uri=mast:JWST/product/
↪jw02107038001_02105_00001_mirimage_cal.fits to ./mastDownload/JWST/jw02107038001_02105_
↪00001_mirimage/jw02107038001_02105_00001_mirimage_cal.fits ... [Done]
```

Examine the Reference Image

```
files = glob.glob('mastDownload/JWST/*miri*/*cal.fits')
ref_image = files[0]
print(ref_image)
ref_fits = fits.open(ref_image)
ref_data = fits.open(ref_image)[['SCI',1].data
norm1 = simple_norm(ref_data,stretch='log',min_cut=5,max_cut=25)

plt.imshow(ref_data, origin='lower',
           norm=norm1,cmap='gray')
plt.gca().tick_params(labelcolor='none',axis='both',color='none')
plt.show()
```

`mastDownload/JWST/jw02107038001_02101_00001_mirimage/jw02107038001_02101_00001_mirimage_`
`↪cal.fits`

Zoom in to see the offset

Here add an artificial offset to the wcs, and then we see the same star in both images at the same ra/dec location, demonstrating a large offset between the images.

```
star_location = SkyCoord('23:09:44.0809', '-43:26:05.613', unit=(u.hourangle, u.deg))
align_image = files[1]
align_fits = fits.open(align_image)
align_fits['SCI', 1].header['CRPIX1']+=2
align_fits['SCI', 1].header['CRPIX2']+=2
align_fits.writeto(align_image, overwrite=True)

align_data = fits.open(align_image)[ 'SCI', 1].data
ref_y, ref_x = skycoord_to_pixel(star_location, wcs.WCS(ref_fits['SCI', 1], ref_fits))
align_y, align_x = skycoord_to_pixel(star_location, wcs.WCS(align_fits['SCI', 1], align_
↪fits))

ref_cutout = extract_array(ref_data, (11, 11), (ref_x, ref_y))
align_cutout = extract_array(align_data, (11, 11), (align_x, align_y))
norm1 = simple_norm(ref_cutout, stretch='log', min_cut=-1, max_cut=200)
norm2 = simple_norm(align_cutout, stretch='log', min_cut=-1, max_cut=200)
```

(continues on next page)

(continued from previous page)

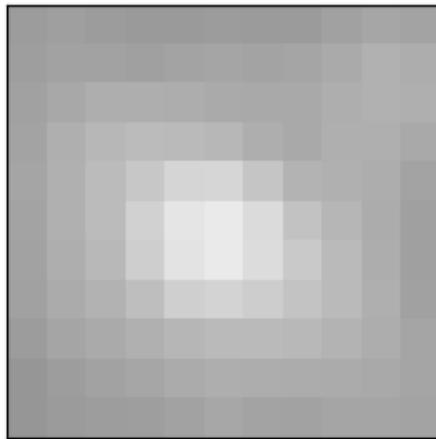

```

fig,axes = plt.subplots(1,2)
axes[0].imshow(ref_cutout, origin='lower',
                norm=norm1,cmap='gray')
axes[1].imshow(align_cutout, origin='lower',
                norm=norm2,cmap='gray')
axes[0].set_title('Reference')
axes[1].set_title('To Align')
axes[0].tick_params(labelcolor='none',axis='both',color='none')
axes[1].tick_params(labelcolor='none',axis='both',color='none')

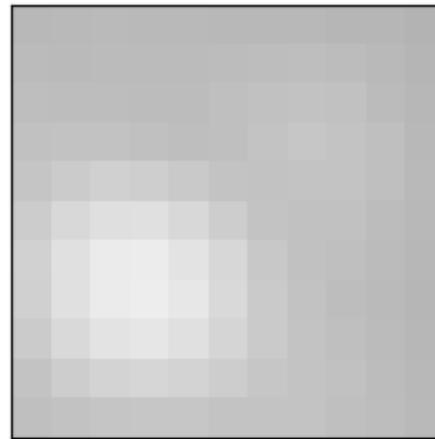

plt.show()

```

Align the second image

The plots outputted here show the various steps used by jhat to determine the true matching sources in the image, and the subsequent correction needed for optimal alignment.

```
wcs_align = st_wcs_align()

wcs_align.run_all(align_image,
                  telescope='jwst',
                  outsubdir='mastDownload',
                  refcat_racol='ra',
                  refcat_deccol='dec',
                  refcat_magcol='mag',
                  refcat_magerrcol='dmag',
                  overwrite=True,
                  d2d_max=1,
                  showplots=2,
                  refcatname=ref_catname,
                  histocut_order='dxdy',
                  sharpness_lim=(0.3, 0.9),
                  roundness1_lim=(-0.7, 0.7),
                  SNR_min= 3,
                  dmag_max=1.0,
                  objmag_lim =(14, 24))

import jhat
from jhat import jwst_photclass,st_wcs_align
```

6.2.1 Relative Alignment

Download some Data

For this example we download 2 JWST NIRCam images from MAST. They're the same field but different filters. Note that the code will also work for level 3 data images.

```
obs_table1 = Observations.query_criteria(obs_id='jw02107-o041_t019_nircam_clear-f200w')
data_products_by_obs = Observations.get_product_list(obs_table1)
data_products_by_obs = data_products_by_obs[data_products_by_obs['calib_level']==2]
data_products_by_obs = data_products_by_obs[data_products_by_obs[
    'productSubGroupDescription']=='CAL'][0]
Observations.download_products(data_products_by_obs,extension='fits')

obs_table2 = Observations.query_criteria(obs_id='jw02107-o041_t019_nircam_clear-f360m')
data_products_by_obs = Observations.get_product_list(obs_table2)
data_products_by_obs = data_products_by_obs[data_products_by_obs['calib_level']==2]
data_products_by_obs = data_products_by_obs[data_products_by_obs[
    'productSubGroupDescription']=='CAL'][0]
Observations.download_products(data_products_by_obs,extension='fits')
```

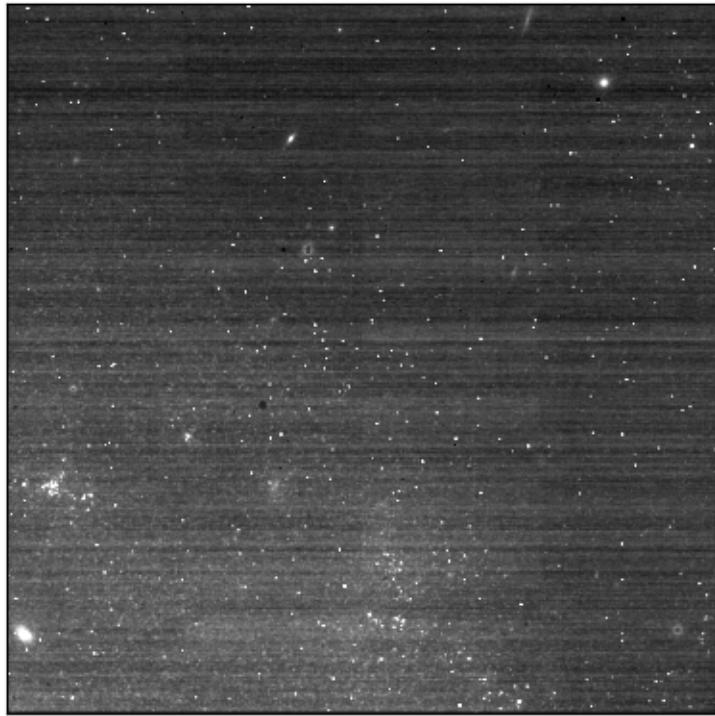

```

↪ 00001_ncb1long/jw02107041001_02101_00001_ncb1long_cal.fits ... [Done]
```

Examine the Reference Image

```
ref_image = glob.glob('mastDownload/JWST/*nrcb1*/*cal.fits')[0]

ref_fits = fits.open(ref_image)
ref_data = fits.open(ref_image)[['SCI',1].data
norm1 = simple_norm(ref_data,stretch='linear',min_cut=-.5,max_cut=3)

plt.imshow(ref_data, origin='lower',
           norm=norm1,cmap='gray')
plt.gca().tick_params(labelcolor='none',axis='both',color='none')
plt.show()
```

Zoom in to see the offset

Here add an artificial offset to the wcs, and then we see the same star in both images at the same ra/dec location, demonstrating a large offset between the images.

```
star_location = SkyCoord('23:09:41.0532', '-43:26:41.128', unit=(u.hourangle, u.deg))
align_image = glob.glob('mastDownload/JWST/*long/*cal.fits')[0]
align_fits = fits.open(align_image)
align_fits['SCI', 1].header['CRPIX1']+=1
align_fits['SCI', 1].header['CRPIX2']+=1
align_fits.writeto(align_image, overwrite=True)

align_data = fits.open(align_image)['SCI', 1].data
ref_y, ref_x = skycoord_to_pixel(star_location, wcs.WCS(ref_fits['SCI', 1], ref_fits))
align_y, align_x = skycoord_to_pixel(star_location, wcs.WCS(align_fits['SCI', 1], align_
fits))

ref_cutout = extract_array(ref_data, (11, 11), (ref_x, ref_y))
align_cutout = extract_array(align_data, (11, 11), (align_x, align_y))
norm1 = simple_norm(ref_cutout, stretch='linear', min_cut=-.5, max_cut=3)
norm2 = simple_norm(align_cutout, stretch='linear', min_cut=-.5, max_cut=3)
fig, axes = plt.subplots(1, 2)
axes[0].imshow(ref_cutout, origin='lower',
               norm=norm1, cmap='gray')
axes[1].imshow(align_cutout, origin='lower',
               norm=norm2, cmap='gray')
```

(continues on next page)

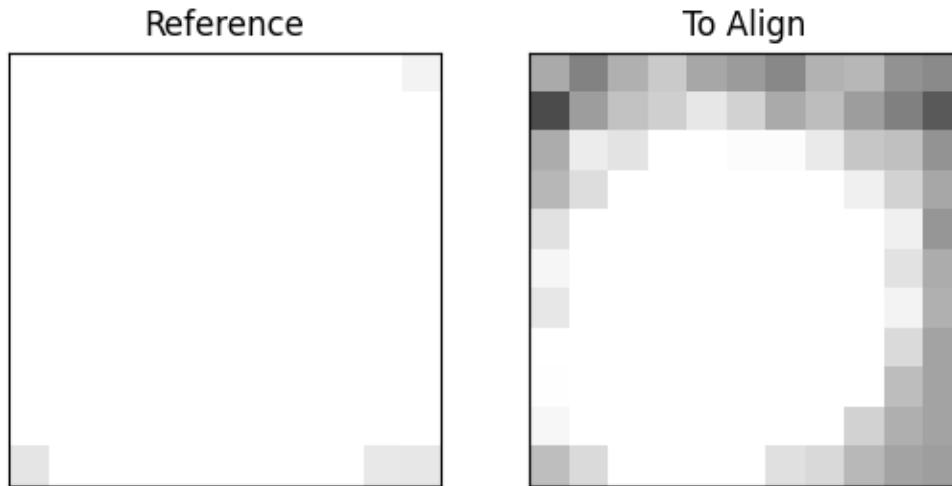

(continued from previous page)

6.3.1 Relative Alignment

Download some Data

For this example we download 2 HST DRZ images from MAST. They're the same filter and same field, just separated in time.

```
obs_table = Observations.query_criteria(obs_id='hst_16264_12_wfc3_ir_f110w_iebc12')
obs_table1 = obs_table[obs_table['filters']=='F110W']

obs_table = Observations.query_criteria(obs_id='hst_16264_15_wfc3_ir_f110w_iebc15')
obs_table2 = obs_table[obs_table['filters']=='F110W']

data_products_by_obs = Observations.get_product_list(obs_table1)
data_products_by_obs = data_products_by_obs[data_products_by_obs['calib_level']==3]
data_products_by_obs = data_products_by_obs[data_products_by_obs[
    'productSubGroupDescription']=='DRZ'][0]
Observations.download_products(data_products_by_obs,extension='fits')

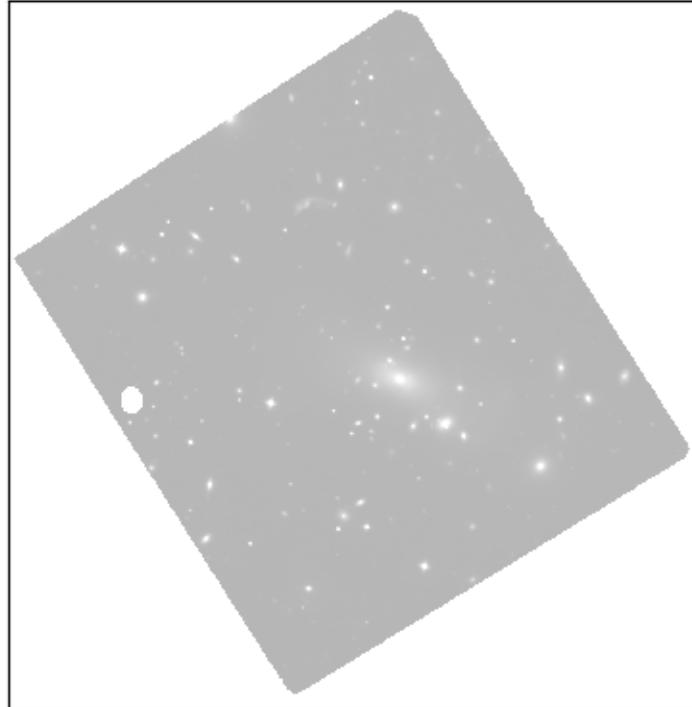

data_products_by_obs = Observations.get_product_list(obs_table2)
data_products_by_obs = data_products_by_obs[data_products_by_obs['calib_level']==3]
data_products_by_obs = data_products_by_obs[data_products_by_obs[
    'productSubGroupDescription']=='DRZ'][0]
Observations.download_products(data_products_by_obs,extension='fits')
```

```
Downloading URL https://mast.stsci.edu/api/v0.1/Download/file?uri=mast:HST/product/hst_

```

Examine the Reference Image

```
files = glob.glob('mastDownload/HST/*/*drz.fits')
ref_image = files[0]
ref_fits = fits.open(ref_image)
ref_data = fits.open(ref_image)[['SCI', 1].data
norm1 = simple_norm(ref_data, stretch='log', min_cut=-1, max_cut=15)

plt.imshow(ref_data, origin='lower',
           norm=norm1, cmap='gray')
plt.gca().tick_params(labelcolor='none', axis='both', color='none')
plt.show()
```

Zoom in to see the offset

Here add an artificial offset to the wcs, and then we see the same star in both images at the same ra/dec location, demonstrating a large offset between the images.

```

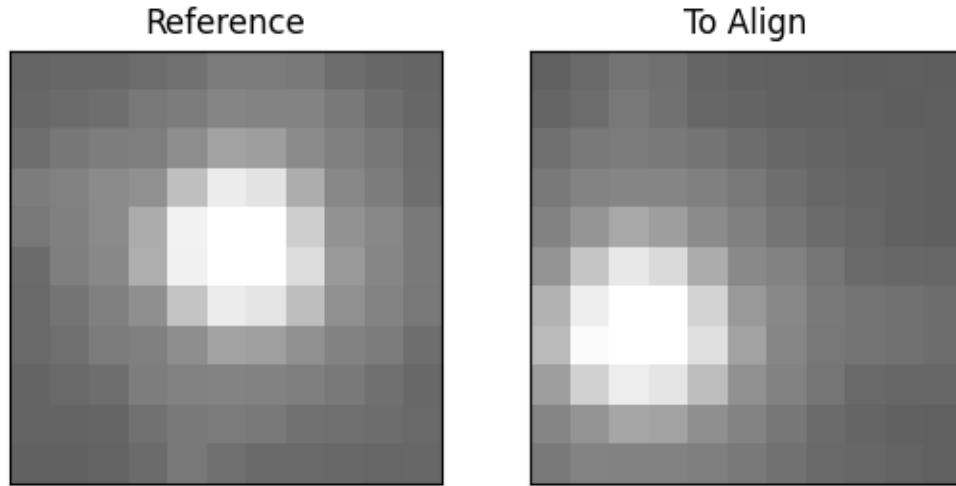

star_location = SkyCoord('21:29:40.5351', '+0:04:42.697', unit=(u.hourangle, u.deg))
align_image = files[1]
align_fits = fits.open(align_image)
align_fits['SCI', 1].header['CRPIX1']+=2
align_fits['SCI', 1].header['CRPIX2']+=2
align_fits.writeto(align_image, overwrite=True)

align_data = fits.open(align_image)['SCI', 1].data
ref_y, ref_x = skycoord_to_pixel(star_location, wcs.WCS(ref_fits['SCI', 1], ref_fits))
align_y, align_x = skycoord_to_pixel(star_location, wcs.WCS(align_fits['SCI', 1], align_fits))

ref_cutout = extract_array(ref_data, (11, 11), (ref_x, ref_y))
align_cutout = extract_array(align_data, (11, 11), (align_x, align_y))
norm1 = simple_norm(ref_cutout, stretch='log', min_cut=-1, max_cut=200)
norm2 = simple_norm(align_cutout, stretch='log', min_cut=-1, max_cut=200)
fig, axes = plt.subplots(1, 2)
axes[0].imshow(ref_cutout, origin='lower',
               norm=norm1, cmap='gray')
axes[1].imshow(align_cutout, origin='lower',
               norm=norm2, cmap='gray')
axes[0].set_title('Reference')
axes[1].set_title('To Align')
axes[0].tick_params(labelcolor='none', axis='both', color='none')
axes[1].tick_params(labelcolor='none', axis='both', color='none')

plt.show()

```

Create a Photometric Catalog for Relative Alignment

We choose one of the images to be the reference image, and then create a catalog that we will use to align the other image.

```
hst_phot = hst_photclass(psf_fwhm=1.8,aperture_radius=5)
hst_phot.run_phot(imagename=ref_image,photfilename='auto',overwrite=True)
ref_catname = ref_image.replace('.fits','.phot.txt') # the default
refcat = Table.read(ref_catname,format='ascii')
print(refcat)
```

```

Align the second image

The plots outputted here show the various steps used by jhat to determine the true matching sources in the image, and the subsequent correction needed for optimal alignment.

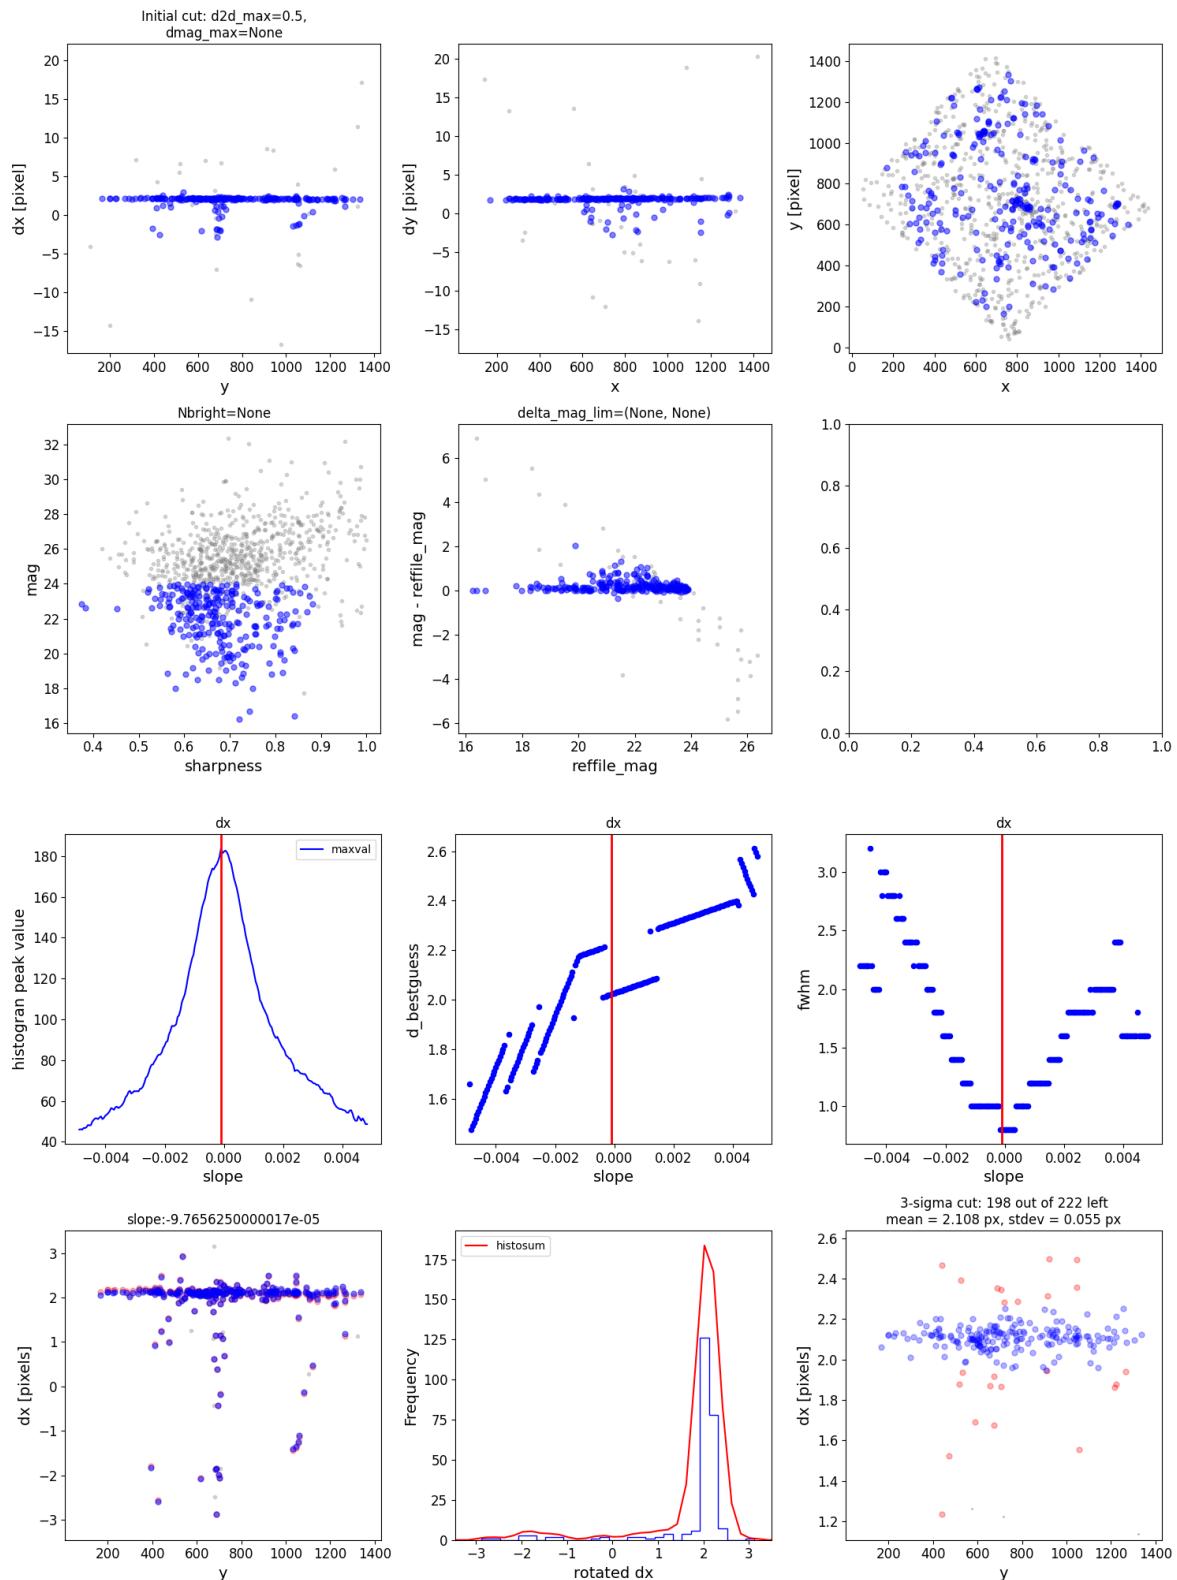

```
wcs_align = st_wcs_align()

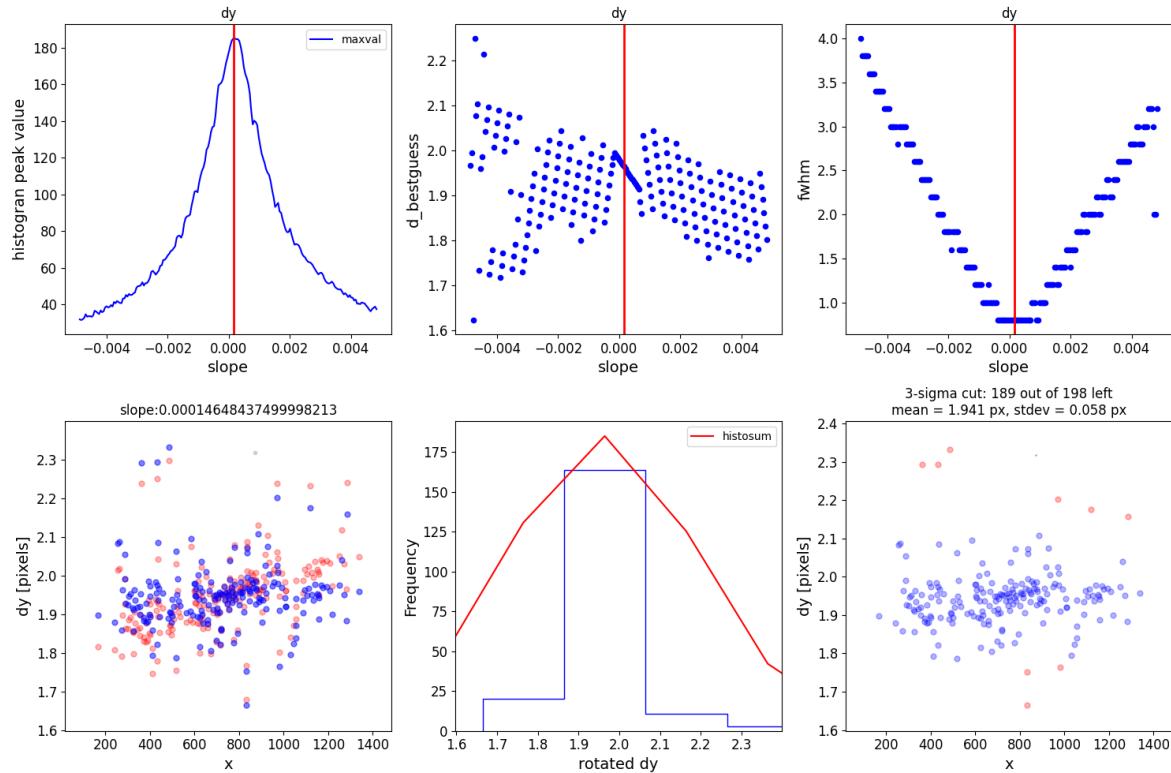

wcs_align.run_all(align_image,
                  telescope='hst',
                  outsubdir='mastDownload',

Failed for not enough matches!

```

This is what a failure looks like (compare to the plots above). There are now a couple of options here. You can increase the d2d_max parameter, which increases the allowed distance between sources being matched in the reference and target images:

```

wcs_align = st_wcs_align()

wcs_align.run_all(align_image,
                  telescope='hst',
                  outsubdir='mastDownload',
                  refcat_racol='ra',
                  refcat_deccol='dec',
                  refcat_magcol='mag',
                  refcat_magerrcol='dmag',
                  overwrite=True,
                  d2d_max=1,
                  showplots=2,
                  refcatname=ref_catname,
                  histocut_order='dxdy',
                  sharpness_lim=(0.3, 0.9),
                  roundness1_lim=(-0.7, 0.7),
                  SNR_min= 3,
                  dmag_max=1.0,
                  objmag_lim =(14, 24))

aligned_image = os.path.join('mastDownload',os.path.basename(align_image).replace('drz.
↳ fits','jhat.fits'))
aligned_fits = fits.open(aligned_image)
aligned_data = fits.open(aligned_image)[ 'SCI', 1].data
aligned_y,aligned_x = skycoord_to_pixel(star_location, wcs.WCS(aligned_fits[ 'SCI', 1],
↳ aligned_fits))
aligned_cutout = extract_array(aligned_data,(11,11),(aligned_x,aligned_y))

norm3 = simple_norm(aligned_cutout,stretch='log',min_cut=-1,max_cut=200)

```

(continues on next page)

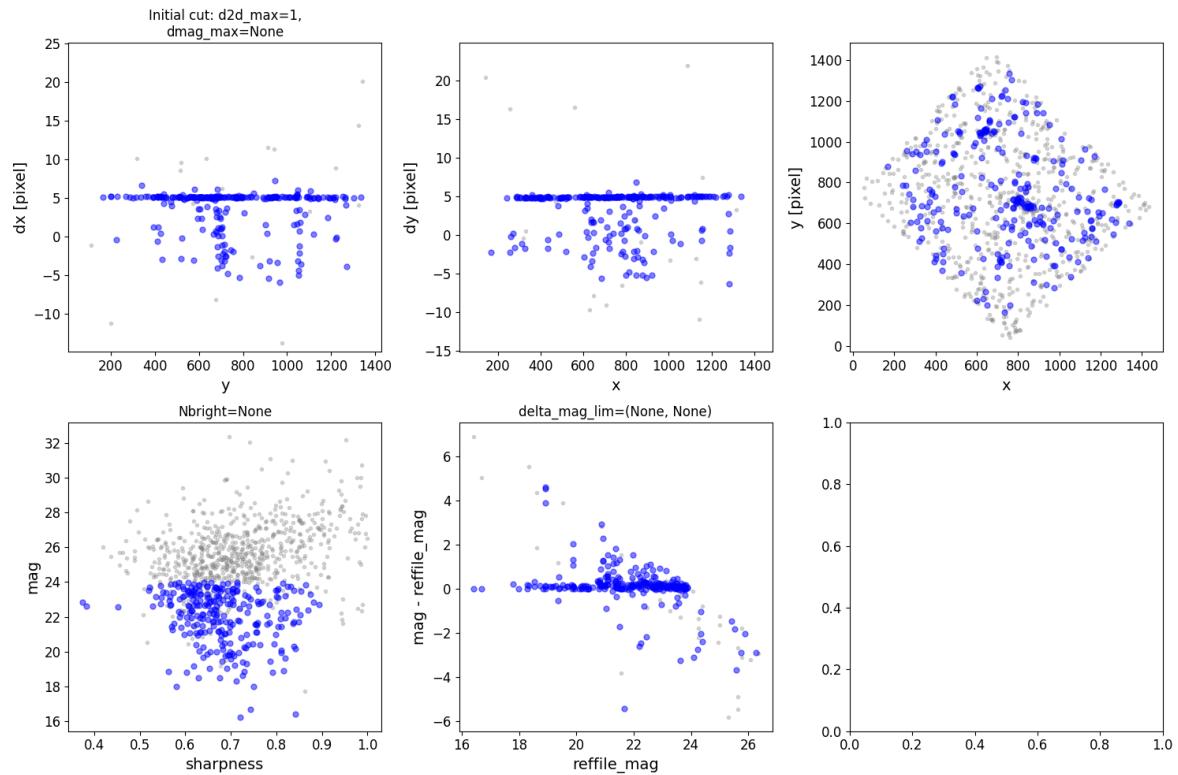

(continued from previous page)

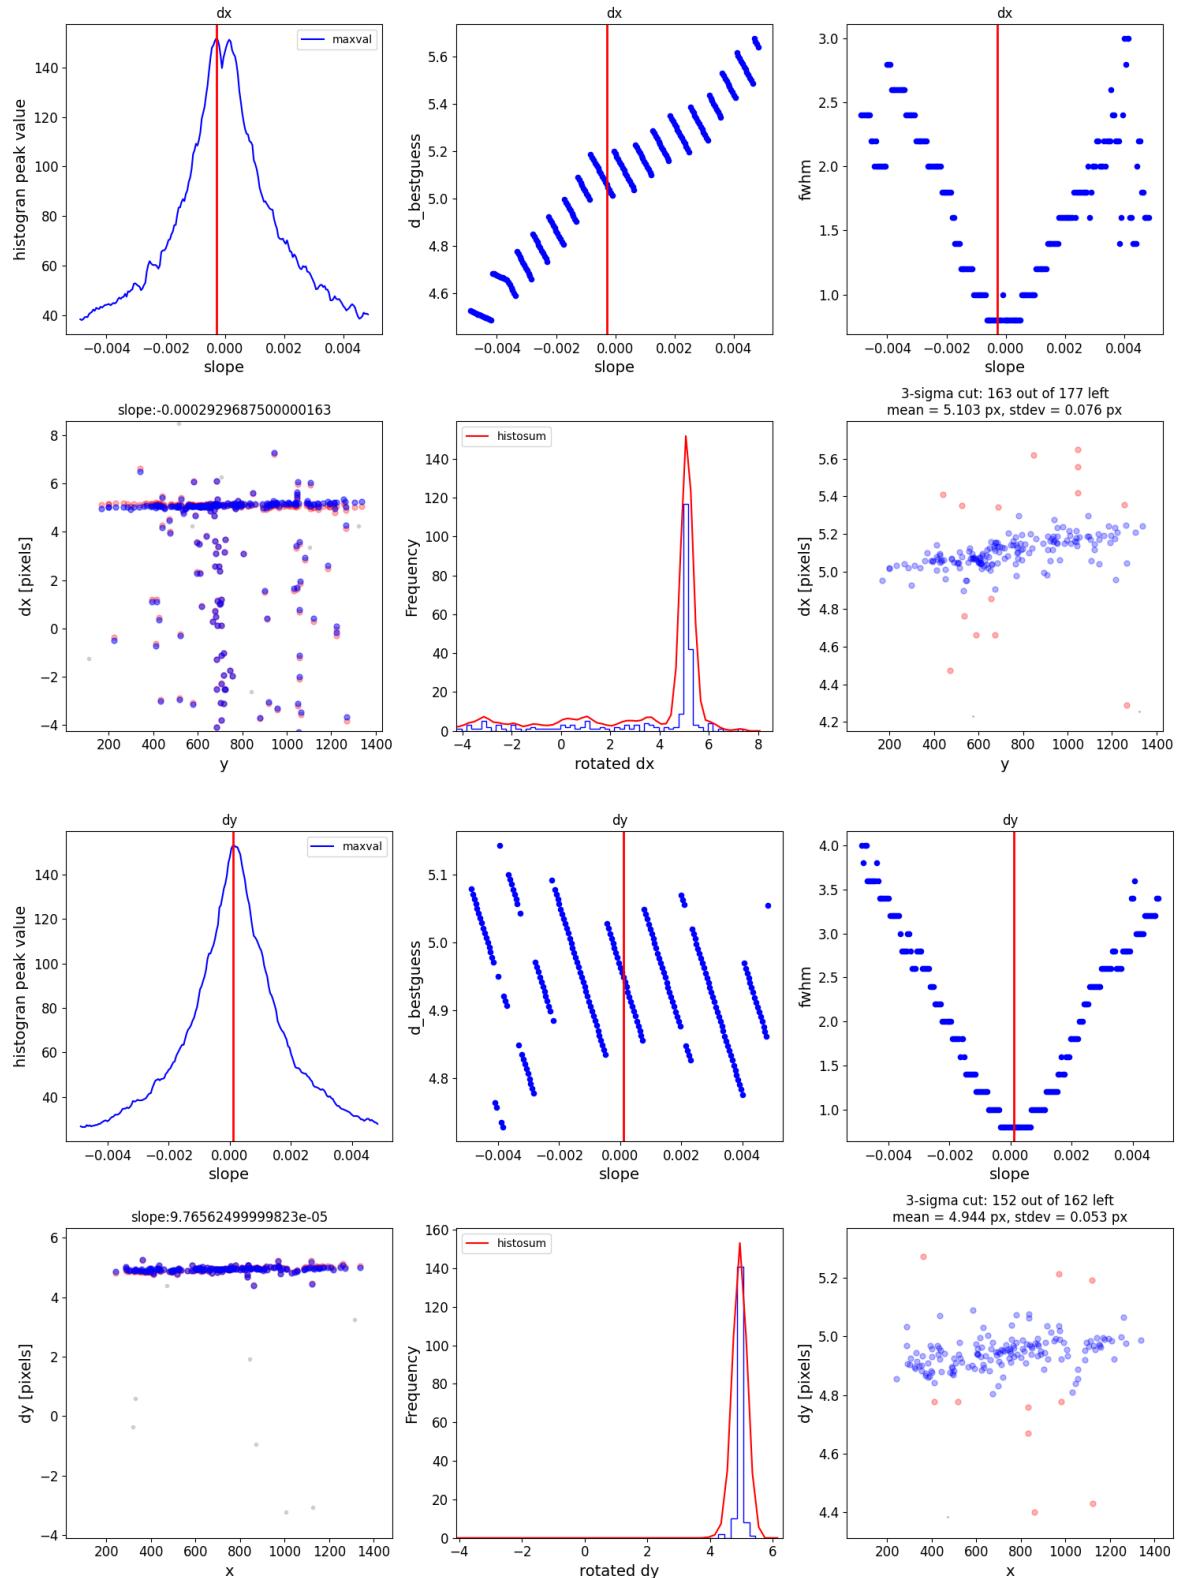

```

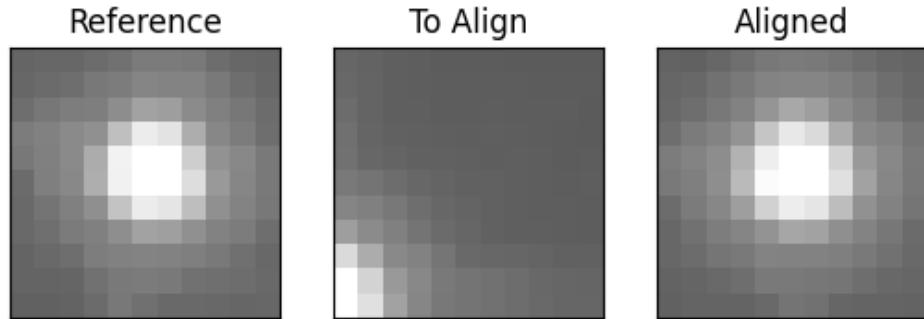

fig,axes = plt.subplots(1,3)

6.4 API Documentation

6.4.1 jhat

st_wcs_align

Created on Thu Apr 21 14:32:42 2022

@author: arest, bhilbert, mcorrenti, acanipe, jpierel

class jhat.st_wcs_align.st_wcs_align

Main class for alignment.

outrootdir

output root directory. The output directory is the output root directory + the outsubdir if not None

Type

str

outsubdir

outsubdir added to output root directory

Type

str

overwrite

overwrite files if they exist.

Type

bool

telescope

If None, then telescope is determined automatically from the filename (“jw*” and “hst*” for JWST and HST, respectively)

Type

str

skip_if_exists

Skip doing the analysis of a given input image if the cal file already exists, assuming the full analysis has been already done

Type

bool

verbose

verbosity count (lower is less verbose)

Type

int

SNR_min

minimum SNR for objects in image to be used for analysis

Type

float

use_dq

use the DQ extensions for masking

Type

bool

refcat

reference catalog. Can be a filename or Gaia

Type

str

refcat_racol

RA column of reference catalog. If None, then automatically determined

Type

str

refcat_deccol

Dec column of reference catalog. If None, then automatically determined

Type

str

refcat_magcol

mag column of reference catalog. If None and not one of the default refcats like gaia, then 3rd column is used

Type

str

refcat_magerrcol

magerr column of reference catalog. If None, then not used

Type

str

refcat_colorcol

color column of reference catalog. If None, then not used

Type

str:

refcat_pmflag

Apply the proper motion correction (only for catalogs it is applicable, e.g., gaia

Type

bool

refcat_pmmedian

Apply the MEDIAN proper motion correction (only for catalogs it is applicable, e.g., gaia

Type

bool

photfilename

photometry output filename. if “auto”, the fits in the image filename is substituted with phot.txt

Type

str

load_photcat_if_exists

If the photometric catalog file already exists, skip recreating it.

Type

bool

rematch_refcat

if --load_photcat_if_exists and the photcat already exists, load the photcat, but rematch with refcat

Type

bool

d2d_max

maximum distance between source in image and refcat object, in arcsec

Type

float

dmag_max

maximum uncertainty of sources in image

Type

float

sharpness_lim

sharpness limits of sources in image (iterable of length 2)

Type

list of float

roundness1_lim

roundness1 limits of sources in image (iterable of length 2)

Type

list of float

delta_mag_lim

limits on mag - refcat_mainfilter (iterable of length 2)

Type

list of float

objmag_lim

limits on mag, the magnitude of the objects in the image (iterable of length 2)

Type

list of float

refmag_lim

limits on refcat_mainfilter, the magnitude of the reference catalog (iterable of length 2)

Type

list of float

slope_min

minimum slope for linear correction applied to dx/dy. This effectively accounts for rotation. slopes go from slopemin to -slopemin

Type

float

Nbright4match

Use only Nbright brightest objects for matching to the ref cat

Type

int

Nbright

Use only Nbright brightest objects in image that are matched to refcat for alignment

Type

int

histocut_order

histocut_order defines whether the histogram cut is first done for dx or first for dy (choices are ‘dxdy’ or ‘dydx’)

Type

str

xshift

added to the x coordinate before calculating ra,dec (only impacts ra,dec, not x). This can be used to correct for large shifts before matching!

Type

float

yshift

added to the y coordinate before calculating ra,dec (only impacts ra,dec, not y). This can be used to correct for large shifts before matching!

Type

float

iterate_with_xyshifts

After the first histogram fit, redo the match with refcat with x/yshift=median(dx/dy) and redo histofit. Use this if the offsets are big, since the second iteration will give you better matching with the refcat

Type

bool

showplots

showplots=1: most important plots. showplots=2: all plots (debug/test/fine tune)

Type

int

saveplots

saveplots=1: most important plots. saveplots=2: all plots (debug/test/fine tune)

Type

int

savephottable

Save the final photometry table

Type

bool

replace_sip

Replace the tweaked fits image wcs with the SIP representation.

Type

bool

sip_err

max_pix_error for SIP transformation.

Type

float

sip_degree

degree for SIP transformation.

Type

int

sip_points

npoints for SIP transformation.

Type

int

ee_radius

encircled energy percentage (multiples of 10) for photometry

Type

int

rough_cut_px_min

first rough cut: best d_rotated+-rough_cut_pix. This is the lower limit for rough_cut

Type

float

rough_cut_px_max

first rough cut: best d_rotated+-rough_cut_pix. This is the upper limit for rough_cut

Type

float

d_rotated_Nsigma

Nsigma for sigma cut of d_rotated. If 0.0, then 3-sigma cut is skipped

Type

float

set_telescope(telescope=None, imname=None)

Figuring out which telescope your data come from (HST or JWST). Note that if your filename is non-standard, then you MUST set

simple_jwst_phot

Created on Wed Apr 27 09:21:15 2022

@author: arest, jpierel, mcorrenti

This is class wrapper around doing simple photometry on a single JWST image

```
class jhat.simple_jwst_phot.hst_photclass(psf_fwhm=2, aperture_radius=None, verbose=0)
```

The photometry class for HST images.

```
aperture_phot(filt=None, pupil=None, radii_Nfwhm=None, radius_Nfwhm_sky_in=None,  
radius_Nfwhm_sky_out=None, radius_Nfwhm_for_mag=None, primaryhdr=None,  
scihdr=None)
```

Aperture photometry routine for HST.

Returns

table_aper

Return type

`astropy.table.Table`

```
match_refcat(max_sep=1.0, borderpadding=40, refcatshort=None, ixs_obj=None, ixs_refcat=None)
```

Matches the photometry catalog to the reference catalog.

Parameters

- **max_sep** (`float`) – Maximum separation between sources in arcseconds
- **borderpadding** (`float`) – Pixel separation required from border of image
- **refcatshort** (`string, optional`) – Short name of reference catalog that is used as prefix for the column names. The default is None. If None, then refcatshort is set to self.refcat.short
- **indices** (`list`) – The indices to access the photometry catalog, default None (use the full catalog)

Return type

None.

```
class jhat.simple_jwst_phot.jwst_photclass(verbose=0)
```

The photometry class for JWST images.

```
aperture_phot(filt=None, pupil=None, radii_Nfwhm=None, radius_Nfwhm_sky_in=None,  
radius_Nfwhm_sky_out=None, radius_Nfwhm_for_mag=None, primaryhdr=None,  
scihdr=None)
```

Aperture photometry routine for HST.

Returns

table_aper

Return type

`astropy.table.Table`

```
find_stars(threshold=3, var_bkg=False, primaryhdr=None, scihdr=None)
```

Parameters

- **threshold** (`float`) – The absolute image value above which to select sources.
- **fwhm** (`float`) – The full-width half-maximum (FWHM) of the major axis of the Gaussian kernel in units of pixels.

- **var_bkg** (*bool*) – Use Background2D (see description above)

match_refcat(*max_sep=1.0, borderpadding=40, refcatshort=None, ixs_obj=None, ixs_refcat=None*)

Matches the photometry catalog to the reference catalog.

Parameters

- **max_sep** (*float*) – Maximum separation between sources in arcseconds
- **borderpadding** (*float*) – Pixel separation required from border of image
- **refcatshort** (*string, optional*) – Short name of reference catalog that is used as prefix for the column names. The default is None. If None, then refcatshort is set to self.refcat.short
- **indices** (*list*) – The indices to access the photometry catalog, default None (use the full catalog)

Return type

None.
